## Task 1. Dimerization of Acetic Acid

1.1) The reaction can be represented as $2 \mathrm{CH}_{3} \mathrm{COOH} \rightleftharpoons\left(\mathrm{CH}_{3} \mathrm{COOH}\right)_{2}$. If we begin with, say, $100.0 \mathrm{~mol} \mathrm{CH}_{3} \mathrm{COOH}$ and $92.0 \%$ dimerizes, then 8.0 mol will be present at equilibrium. The 92.0 mol that react give rise to 46.0 mol dimers. The total number of moles present is therefore 54.0. Hence using the data at 298 K , the equilibrium constant, $K_{\mathrm{p}}$, is given by

$$
K_{P}=\frac{P_{\left(\mathrm{CH}_{3} \mathrm{COOH}\right)_{2}}}{\left(P_{\mathrm{CH}_{3} \mathrm{COOH}}\right)^{2}}=\frac{X_{\left(\mathrm{CH}_{3} \mathrm{COOH}\right)_{2}} P_{\mathrm{tot}}}{\left(X_{\mathrm{CH}_{3} \mathrm{COOH}} P_{\mathrm{tot}}\right)^{2}}=\frac{(46.0 / 54.0)(0.200)}{\left[(8.0 / 54.0)(0.200]^{2}\right.}=194
$$

From equation $\Delta \mathrm{G}^{\circ}=-R T \ln K_{\mathrm{p}}$,
At $298 \mathrm{~K}, \Delta \mathrm{G}^{\circ}=-R T \ln K_{\mathrm{p}}$

$$
\begin{aligned}
& =-\left(8.314 \mathrm{~J} \mathrm{~K}^{-1} \mathrm{~mol}^{-1}\right)(298 \mathrm{~K}) \ln (194) \\
& =-13.0 \mathrm{~kJ} \mathrm{~mol}^{-1} \\
& =-R T \ln K_{\mathrm{p}} \\
& =-\left(8.314 \mathrm{~J} \mathrm{~K}^{-1} \mathrm{~mol}^{-1}\right)(318 \mathrm{~K}) \ln (37.3) \\
& =-9.57 \mathrm{~kJ} \mathrm{~mol}^{-1}
\end{aligned}
$$

At $318 \mathrm{~K}, \Delta \mathrm{G}^{\circ}=-R T \ln K_{\mathrm{p}}$

Applying the equation $\Delta \mathrm{G}^{\circ}=\Delta \mathrm{H}^{\circ}-\mathrm{T} \Delta \mathrm{S}^{\circ}$ :
The method for the calculation is to write the two equations
$\Delta \mathrm{G}^{\circ}(298 \mathrm{~K})=-13.0 \mathrm{~kJ} \mathrm{~mol}^{-1}=\Delta \mathrm{H}^{\circ}$ - (298) $\Delta \mathrm{S}^{\circ}$
$\Delta \mathrm{G}^{\circ}(318 \mathrm{~K})=-9.57 \mathrm{~kJ} \mathrm{~mol}^{-1}=\Delta \mathrm{H}^{\circ}-(318) \Delta \mathrm{S}^{\circ}$
and solve the equations simultaneously.
Then $\Delta \mathrm{H}^{\circ}=-64.1 \mathrm{~kJ} \mathrm{~mol}^{-1}$ and $\Delta \mathrm{S}^{\circ}=-170 \mathrm{~J} \mathrm{~K}^{-1} \mathrm{~mol}^{-1}$.
1.2) Applying the Le Chatelier's principle, an increase of pressure should favor the dimerization.
1.3) The extent of dimerization
decreases with increasing the temperature.

## Task 4. Vibrational Frequency of a Diatomic Molecule

4.1) To find the reduced mass of $C X, \mu C X$ :

$$
\begin{aligned}
& E_{0}=\left(0+\frac{1}{2}\right) h v=\frac{1}{2} h v \\
& E_{1}=\left(1+\frac{1}{2}\right) h v=\frac{3}{2} h v \\
& \Delta E=E_{1}-E_{2}=\left(\frac{3}{2}-\frac{1}{2}\right) h v=h v \\
& \Delta E=h c\left(\frac{1}{\lambda}\right)=h \frac{1}{2 \pi} \sqrt{\frac{k}{\mu}} ; v=\frac{1}{2 \pi} \sqrt{\frac{k}{\mu}} \\
& c\left(\frac{1}{\lambda}\right)=\frac{1}{2 \pi} \sqrt{\frac{k}{\mu}} \\
& k=4 \pi^{2} c^{2} \mu\left(\frac{1}{\lambda}\right)^{2}
\end{aligned}
$$

$\mu=\frac{k}{4 \pi^{2} c^{2}\left(\frac{1}{\lambda}\right)^{2}}$
$\mu=\frac{1.903 \times 10^{3}}{4(3.14)^{2}\left(2.9979 \times 10^{10} \mathrm{~cm}^{-1} \mathrm{~s}^{2}\left(2170.0 \mathrm{~cm}^{-1}\right)^{2}\right.}$
$\mu=1.140 \times 10^{-26} \mathrm{~kg}=6.866 \mathrm{amu}$
$\mu=6.866 \mathrm{amu}$
4.2) To find mass of the atom $X, m_{x}$ :
$\mu_{C X}=\frac{m_{C} m_{X}}{m_{C}+m_{X}}$
$\mu_{C X}\left(m_{C}+m_{X}\right)=m_{C} m_{X}$
$\mu_{C X} m_{C}+\mu_{C X} m_{X}=m_{C} m_{X}$
$m_{C} m_{X}-\mu_{C X} m_{X}=\mu_{C X} m_{C}$
$m_{x}=\frac{\mu_{C X} m_{C}}{m_{C}-\mu_{C X}}$
$m_{X}=\frac{6.866 \times 12.011}{12.011-6.866}=\frac{82.47}{5.145}=16.03$
Thus, atom $X$ should be oxygen.
Task 24. Compound Identification and Related Chemistry
24.1) $\mathrm{MCl}_{3}$ and $\mathrm{M}=\mathrm{Al}$

Theoretically, the maximum amount of the product is obtained when the mole fraction of M and $\mathrm{Cl}_{2}$ are in the correct stoichiometric ratio. Based on the experiments, $\mathrm{M}: \mathrm{Cl}_{2}=0.4: 0.6$ or $2 / 3$ is the stoichiometric ratio needed to form $\mathrm{M}_{x} \mathrm{Cl}_{y}$. Thus, the equation is as follows:

$$
2 \mathrm{M}+3 \mathrm{Cl}_{2}=2 \mathrm{MCl}_{3} .
$$

The chemical formula of $\mathrm{M}_{x} \mathrm{Cl}_{y}=\mathrm{MCl}_{3}$
Since 0.4 mole of M generates 0.4 mole of $\mathrm{MCl}_{3}$, the molar mass of $\mathrm{MCl}_{3}$ and atomic mass of M can be derived:
Molar mass of $\mathrm{MCl}_{3}=53.3 \mathrm{~g} / 0.40 \mathrm{~mol}=133 \mathrm{~g} \mathrm{~mol}^{-1}$
$A(M)=133-\left(3^{*}\right.$ atomic mass CI) $=133.3-\left(3^{*} 35.45\right)=26.9 \mathrm{~g} \mathrm{~mol}^{-1}$
$\mathrm{M}=\mathrm{Al}$
24.2) (i) $\mathrm{AlCl}_{3}+3 \mathrm{H}_{2} \mathrm{O}=\mathrm{Al}(\mathrm{OH})_{3}+3 \mathrm{HCl}$
(ii) $2 \mathrm{AlCl}_{3}+3 \mathrm{H}_{2} \mathrm{SO}_{4}=\mathrm{Al}_{2}\left(\mathrm{SO}_{4}\right)_{3}+6 \mathrm{HCl}$
24.3) $\mathrm{Cl}_{\mathrm{Cl}}{ }^{\circ} \cdot \mathrm{Al}_{-}^{-\mathrm{Cl}}-\mathrm{Cl} \cdot \mathrm{Al} \cdot \stackrel{\mathrm{Cl}}{-\mathrm{Cl}}$

## Task 25. Isomerism of Octahedral Fe(II) Complexes

 25.1)
isomer $\mathbf{A}$
cis(Cl,Cl)
$\operatorname{trans}\left(\mathrm{N}^{\prime}, \mathrm{N}^{\prime}\right), \operatorname{cis}(\mathrm{N}, \mathrm{N})$

isomer $\mathbf{A}^{*}$
$\operatorname{cis}(\mathrm{Cl}, \mathrm{Cl})$
$\operatorname{trans}\left(\mathrm{N}^{\prime}, \mathrm{N}^{\prime}\right), \operatorname{cis}(\mathrm{N}, \mathrm{N})$

isomer C
trans(CI,Cl)
$\operatorname{cis}\left(\mathrm{N}^{\prime}, \mathrm{N}^{\prime}\right), \operatorname{cis}(\mathrm{N}, \mathrm{N})$

isomer B
$\operatorname{cis}(\mathrm{Cl}, \mathrm{Cl})$
$\operatorname{cis}\left(\mathrm{N}^{\prime}, \mathrm{N}^{\prime}\right), \operatorname{trans}(\mathrm{N}, \mathrm{N})$

isomer D trans(CI,Cl)
$\operatorname{trans}\left(\mathrm{N}^{\prime}, \mathrm{N}^{\prime}\right), \operatorname{trans}(\mathrm{N}, \mathrm{N})$
25.2) isomers $A, A^{*}, B$, and $B^{*}$

THE $34^{\text {TH }}$ INTERNATIONAL CHEMISTRY OLYMPIAD, 2002

## SOLUTION

$4.1 n(\mathrm{CO}, \beta)=3 / 2 \times n\left(\mathrm{CH}_{3} \mathrm{OH}, \gamma\right)=1500 \mathrm{~mol} \mathrm{~s}^{-1}$
$n\left(\mathrm{H}_{2}, \beta\right)=3 \times n(\mathrm{CO}, \beta)=4500 \mathrm{~mol} \mathrm{~s}^{-1}$
$4.2 n(\mathrm{CO}, \gamma)=n(\mathrm{CO}, \beta)-n\left(\mathrm{CH}_{3} \mathrm{OH}, \gamma\right)=(1500-1000) \mathrm{mol} \mathrm{s}^{-1}=500 \mathrm{~mol} \mathrm{~s}^{-1}$
$n\left(\mathrm{H}_{2}, \gamma\right)=n\left(\mathrm{H}_{2}, \beta\right)-2 \times n\left(\mathrm{CH}_{3} \mathrm{OH}, \gamma\right)=(4500-2 \times 1000) \mathrm{mol} \mathrm{s}^{-1}=2500 \mathrm{~mol} \mathrm{~s}^{-1}$
$4.3 n\left(\mathrm{CH}_{4}, \alpha\right)=n(\mathrm{CO}, \beta)=1500 \mathrm{~mol} \mathrm{~s}^{-1}$
$n\left(\mathrm{H}_{2} \mathrm{O}, \alpha\right)=n(\mathrm{CO}, \beta)=1500 \mathrm{~mol} \mathrm{~s}^{-1}$
$4.4 n_{\text {tot }}=(1000+500+2500) \mathrm{mol} \mathrm{s}^{-1}=4000 \mathrm{~mol} \mathrm{~s}^{-1}$
$p_{i}=p_{\text {tot }} \cdot\left(n_{i} / n_{\text {tot }}\right)$
$\mathrm{p}(\mathrm{CO}, \gamma)=10 \mathrm{MPa} \times(500 / 4000)=1,25 \mathrm{MPa}$
$\mathrm{p}\left(\mathrm{H}_{2}, \gamma\right)=10 \mathrm{MPa} \times(2500 / 4000)=6,25 \mathrm{MPa}$
$\mathrm{p}\left(\mathrm{CH}_{3} \mathrm{OH}, \gamma\right)=10 \mathrm{MPa} \times(1000 / 4000)=2,50 \mathrm{MPa}$
