# $50^{\text {th }}$ CHEMISTRY OLYMPIAD <br> Final National Competition 

## ESTONIA

## PROBLEMS

## FORM X

1. Piglet has five balloons. Three of them are filled with the main constituents of the atmospheres of Venus (A), Saturn (B) and Mercury (C). The other two balloons are filled with the compounds which constitute the clouds on the planets Venus (D) and Saturn (E). The balloon with the compound $\mathbf{A}$ falls on the floor, meanwhile the balloons with $\mathbf{B}$ and $\mathbf{E}$ fly up to the ceiling. The compounds $\mathbf{C}$ and $\mathbf{D}$ can't be gaseous at the room temperature; therefore these balloons are not inflated. $\mathbf{D}$ is a heavy oily liquid, which has destroyed the balloon and began to char the floor in Piglet's house. The compound $\mathbf{C}$ can be cut with the knife. It floats on the surface of water. In the reaction of $\mathbf{C}$ with water the gas $\mathbf{B}$ and a solution of $\mathbf{F}$ are formed. A big piece of $\mathbf{C}$ can burst into yellow flame on the surface of water. The compound $\mathbf{F}$ can suppress the corrosive action of $\mathbf{D}$ forming a normal salt $\mathbf{J}$. If the gas $\mathbf{A}$ is passed through the solution of $\mathbf{F}$, a compound $\mathbf{G}$ is formed, which is an
important constituent of baking powder. G neutralizes $\mathbf{D}$ as well forming a normal salt $\mathbf{J}$ with evaluation of the gas $\mathbf{A}$. The compound $\mathbf{E}$ has a characteristic caustic odour. If $\mathbf{A}$ and $\mathbf{E}$ are passed through water an acid salt $\mathbf{H}$ is formed. $\mathbf{H}$ is a component of baking powder as well and neutralizes $\mathbf{D}$ forming a normal salt $\mathbf{I}$, which is used as fertilizer in agriculture.
a) i) What are the main constituents of the atmospheres of the planets Venus, Saturn and Mercury? ii) What compounds constitute clouds on Venus and Saturn? Give formulas and names of the compounds A - E.
b) Which one of the inflated balloons do you consider to be the safest present for Piglet's friend Eeyore? Why are the other balloons dangerous?
c) Why i) does the balloon with the compound $\mathbf{A}$ fall on the floor and ii) why do the balloons with $\mathbf{B}$ and $\mathbf{E}$ fly up to the ceiling?
d) Give formulas and names of compounds F, G, H, I and J.
e) Write equations for the following reactions: i) $\mathbf{C}+\mathrm{H}_{2} \mathrm{O} \rightarrow$; ii) $\mathbf{F}+\mathbf{D} \rightarrow$; iii) $\mathbf{F}+\mathbf{A} \rightarrow$; iv) $\mathbf{G}+\mathbf{D} \rightarrow$; v) $\mathbf{A}+\mathbf{E}+\mathrm{H}_{2} \mathrm{O} \rightarrow$; vi) $\mathbf{H}+\mathbf{D} \rightarrow$.
2. By utilization of a chromatograph 139.88 g of contacts covered with gold were soldered. When the contacts were treated with concentrated nitrous acid, their base made of copper dissolved. During this process $\mathrm{NO}_{2}$ evaluated and 32.61 g of an insoluble residue remained. After washing a grey monohydrate of metastannous acid out from this residue, 5.08 g of pieces of the gold foil were obtained. These pieces were fused in the muffle-furnace in the air atmosphere. The copper content in the formed gold alloy was $5.56 \%$ and there was also 0.636 g of copper (II) oxide formed in the crucible.
a) Write equations of the reactions: i) $\mathrm{Cu}+\mathrm{HNO}_{3}$ conc. $\rightarrow$;
ii) $\mathrm{Sn}+\mathrm{HNO}_{3}$ conc. $\rightarrow$.
b) Which one of tin compounds has the same qualitative and quantitative composition as the compound in the reaction a) ii)?
c) Calculate percentage of tin in the soldered contacts.
d) Calculate percentage of gold in the gold foil.
3. Estonian shale consists of an organic part (kerogen) and a mineral part. From the compounds of the mineral part mainly carbonates decompose as thermally as under treatment with hydrochloric acid. After combustion of 100.0 g of the shale-dust 53.0 g of ashes was obtained. When the same amount of the shale was treated with hydrochloric acid 6.74 liters of carbon dioxide evaluated. 1.9 g of water, 5.6 g of gases, shale-oil and a solid residue are formed after dry distillation of 100.0 g of the shale at $500^{\circ} \mathrm{C}$.
a) Calculate percentage by weight of i) kerogen and ii) mineral substances in the shale, if carbonates decompose totally by combustion.
b) Calculate the yield of the shale-oil obtained from shale, if the yield of the shale-oil from kerogen is $66 \%$.
c) Graphite is formed from a certain part of kerogen by dry distillation. What part (in percents) of $\mathbf{i}$ ) shale and ii) kerogen is converted into graphite by dry distillation?
4. A certain amount of the mixture of copper, iron and aluminium powders was treated with 40.0 g of NaOH in one case (a complex compound with four hydroxyl groups is formed), with $37.4 \mathrm{dm}^{3}$ of chlorine in other case and with $1035 \mathrm{~cm}^{3}$ of $10.0 \%$ solution of $\mathrm{HCl}\left(1.10 \mathrm{~g} / \mathrm{cm}^{3}\right)$ in the third case.
a) Write equations for the reactions of the components of the mixture with i) sodium hydroxide, ii) chlorine and iii) hydrochloric acid.
b) Calculate the masses of i) Al, ii) Fe and iii) Cu in the initial mixture.
5. The oxidizers A, B and $\mathbf{C}$ are used in municipal wastewater purification systems. Their characteristic data is given in the following table:

|  | Oxygen <br> content | Reactivity | Health hazard | Supplied form | Reactions |  |  |
| :--- | ---: | :--- | :--- | :--- | :--- | :--- | :--- |
|  |  |  | A | B | C |  |  |
| A | $94.1 \%$ | 1 | 2 | $35-50 \%$ water solution |  | + | + |
| B | $0 \%$ | 2 | 4 (toxic) | pressurized cylinders | + |  | - |
| C | $40.5 \%$ | 2 | 3 <br> (dust inhalation <br> hazard) | crystalline <br> coloured <br> substance | + | - |  |

All these oxidizers eliminate unpleasant odours of wastewaters by oxidizing hydrogen sulfide. The compound $\mathbf{B}$ oxidizes hydrogen sulphide maximally forming two acids. Sulfide-ion is oxidized at the same extent if it's treated with the oxidizer $\mathbf{C}$ in alkali medium, whereas the degree of oxidation of $\mathbf{C}$ decreases by three. If hydrogen sulfide is treated with oxidizers $\mathbf{A}$ or $\mathbf{C}$ in acidic medium, a pale yellow precipitate is formed.
a) i) Give formulas and names of the compounds $\mathbf{A}, \mathbf{B}$ and $\mathbf{C}$ and
ii) check if their oxygen contents correspond to the data given in the table.
b) Write equations of the following reactions: i) $\mathbf{A}+\mathbf{B} \rightarrow$ simple compound; and ii) $\mathbf{A}+\mathbf{C}+\mathrm{H}_{2} \mathrm{SO}_{4} \rightarrow$ simple compound, whereas the degree of oxidation of the oxidizing element in the compound $\mathbf{C}$
degreases by five.
c) Write equations of the following reactions: i) $\mathrm{H}_{2} \mathrm{~S}+\mathrm{H}_{2} \mathrm{O}+\boldsymbol{B} \rightarrow$; ii) $\mathrm{S}^{2-}+\mathbf{C}++\mathrm{H}_{2} \mathrm{O} \rightarrow$; iii) $\mathrm{H}_{2} \mathrm{~S}+\mathbf{A} \rightarrow$; iv) $\mathrm{H}_{2} \mathrm{~S}+\mathrm{H}_{2} \mathrm{SO}_{4}+\mathbf{C} \rightarrow$.
d) Calculate the amount of NaOH (in moles) which is needed to neutralize the solution formed, if $\mathrm{H}_{2} \mathrm{~S}$ is oxidized by 1 mole of the compound $\mathbf{B}$.
e) Write equations of the reactions which explain over-expenditure of the alkali solution in case oxidizer $\mathbf{B}$ is overdosed.
6. If food oxidation were fast and complete in the organism, a few pieces of sugar would be enough to cause inadmissible overheating of the organism. Sugar oxidation in our bodies is a long complicated biochemical process. According to the Hess's law the total energy change for a chemical reaction depends only on initial and final states of the system. Thus it can be calculated from thermodynamic data.
a) Write equation of the total oxidation of sucrose.
b) Calculate the total energy change for this reaction, if enthalpies of formation $\Delta \mathrm{H}_{\mathrm{f}}$ for the compounds taking part in the reaction are the following:

$$
\begin{aligned}
& \mathrm{C}_{12} \mathrm{H}_{22} \mathrm{O}_{11}(\mathrm{~s})=-2222.0 \mathrm{~kJ} / \mathrm{mol} ; \mathrm{CO}_{2}(\mathrm{~g})=-393.5 \mathrm{~kJ} / \mathrm{mol} ; \\
& \mathrm{H}_{2} \mathrm{O}(\mathrm{I})=-285.8 \mathrm{~kJ} / \mathrm{mol} ; \mathrm{O}_{2}=0 \mathrm{~kJ} / \mathrm{mol} .
\end{aligned}
$$

c) How many grams of sugar should be oxidized to produce the amount of energy needed to evaporate exactly one litre of water?

$$
\Delta \mathrm{H}_{\mathrm{f}}\left(\mathrm{H}_{2} \mathrm{O}(\mathrm{~g})\right)=-241.8 \mathrm{~kJ} / \mathrm{mol} .
$$

## FORM XI

1. When Estonian shale is heated without air access, shale-oil distillation occurs. This shale-oil contains more than 1000 compounds with an average molecular mass of $24 \underline{\underline{0}}$. The obtained oil contains approximately $6.9 \%$ of oxygen, $82 \%$ of carbon and $11 \%$ of hydrogen. The condensation of the gases formed by dry distillation results also in liquation of water vapours, in which some polar compounds are dissolved, e g two-atomic phenols - resorcines, in which hydroxyl groups are in meta-position.
a) Estimate the shale-oil molecule's simplest formula. Consider the percentage to be precise.
b) Express the numbers of atoms in the shale-oil formula in round numbers; and write empirical formula of the saturated compound according to the number of carbon atoms in the form of i) ketone and ii) alcohol.
c) Draw graphic structures of the following compounds dissolved in water: i) 5-methyl resorcine, ii) 5-ethyl resorcine and iii) 2,5-dimethyl resorcine.
d) Draw graphic structures of the following compounds contained in the shale-oil: i) decane, ii) 2-decanone, iii) pentyl cyclohexane, iv) 1,7octadiene, v) 3-methyl phenol and vi) heptane dicarboxylic acid.
2. The acids $\mathbf{A}, \mathbf{B}, \mathbf{C}$ and $\mathbf{D}$ contain two nonmetals $\mathbf{X}$ and $\mathbf{Y}$, besides hydrogen. Dehydration of these acids results in formation of either gases $\mathbf{E}$ and $\mathbf{F}$ or a five-atomic liquid $\mathbf{G}$, which contains $47.0 \%$ of the element $\mathbf{Y}$. The compounds E, F and $\mathbf{G}$ have the same qualitative composition. The acid A can exist only in a very dilute solution, further concentration of which results in the eduction of water from the acid $\mathbf{A}$. Dehydration of the acids $\mathbf{B}$ and $\mathbf{C}$ goes by heating with $\mathrm{H}_{2} \mathrm{SO}_{4}$. If $\mathbf{D}$ is heated with $\mathrm{P}_{4} \mathrm{O}_{10}$, two molecules of water are eliminated from 1 molecule of this acid and the compound $\mathbf{G}$ is formed. Exactly 0.04 moles of NaOH is consumed in
neutralization of 2080 mg of the acid $\mathbf{D}$. The compound $\mathbf{E}$ usually doesn't have acidic properties. However it reacts with NaOH at high temperatures forming a salt I of the acid B. When heated till $400^{\circ} \mathrm{C}$, two molecules of the salt I form sodium salt of the acid $\mathbf{C}$ with evaluation of hydrogen. If a molecule of the compound $\mathbf{G}$ reacts with 2 molecules of methanol, methyl ester of the acid $\mathbf{D}$ is formed.
a) Determine elements $\mathbf{X}$ and $\mathbf{Y}$, as well as compounds $\mathbf{E}$ and $\mathbf{F}$ (formulas and names).
b) Estimate an empirical formula of the compound $\mathbf{G}$ and give its structural formula.
c) From the titration data estimate the molar mass of the acid $\mathbf{D}$ and prove its structural formula.
d) Write structural formulas of the compounds $\mathbf{A}, \mathbf{B}$ and $\mathbf{C}$; write equations of their dehydration and dehydration of the acid $\mathbf{D}$.
e) Write equations of the reactions: i) $\mathbf{E}+\mathrm{NaOH} \rightarrow \mathbf{I}$; ii) I $\rightarrow \mathrm{H}_{2}$; iii) $\mathrm{G}+\mathrm{CH}_{3} \mathrm{OH} \rightarrow$.
3. There are large deposits of the mineral $\mathbf{A}$ in the north-east of Estonia. If this mineral is heated with sand and coal in the furnace, a compound $\mathbf{B}$ is produced. A long heating of the compound $\mathbf{B}$ results in formation of a red compound $\mathbf{C}$. The solid $\mathbf{B}$ shines in the air with the green light and may ignite. Having heard a lot about chemistry but not studied it yet, Peter explained to his friends that the reason for the luminescence of the compound $\mathbf{B}$ is special 3 p orbitals. To prove that he gave five examples:
1) The compound $\mathbf{B}$ doesn't shine under water because water dissolves these special $3 p$ orbitals.
2) If one part of this water solution is added to the equivalent part of the 2 M solution of hydrochloric acid, pH of the resulting solution becomes zero.
3) If alkali solution is added to the compound $\mathbf{B}$, one molecule of $\mathbf{B}$ reacts with three molecules of NaOH and three molecules of water forming three molecules of the compound $\mathbf{D}$ and one molecule of the gas $\mathbf{F}$. The gas $\mathbf{F}$ sublimes in the air because of the sticking of $3 p$ orbitals to its molecules.
4) The compound $\mathbf{F}$ dissolves in water without considerable change in pH of the solution. However, pH of hydrochloric acid solution decreases if the gas $\mathbf{F}$ is passed through it (because of interacting of $3 p$ orbitals with each other).
5) Similar to $2 p$ orbitals of nitrogen, free $3 p$ orbitals separated from the mineral $\mathbf{A}$ by sulfuric acid promote the growth of herbs.
Notice: If someone hasn't realized the Peter's mistake yet, the orbitals can't be separated from the substance as these are the space where an electron can be with the certain probability.
a) Write i) equations for the reaction of obtaining the compound $\mathbf{B}$ and
ii) formulas and names of the compounds $\mathbf{A}, \mathbf{B}, \mathbf{C}$ and $\mathbf{F}$.
b) Write corresponding equations for the example 1-5 or give explanations.
4. The students were given an experimental work. They were asked to prepare a solution of $\mathrm{CuSO}_{4}$ from blue copperas $\left(\mathrm{CuSO}_{4} \cdot 5 \mathrm{H}_{2} \mathrm{O}\right)$. Then 1.22 M solution of $\mathrm{NaHCO}_{3}$ is added to the prepared solution. The formed suspension is heated at $80^{\circ} \mathrm{C}$ until evaluation of the gas ceases. After that the vessel with the mixture is cooled in the air and then in crystallizer filled with water. The formed bluish-green precipitate A is filtered, washed, dried and weighed. If the compound $\mathbf{A}$ is heated a gas $\mathbf{B}$ evaluates. $\mathbf{B}$ is then passed through the lime-water, whereby a precipitate is formed which dissolves in excess of the gas B. After incineration a black substance $\mathbf{C}$ is left in the tube. The compound $\mathbf{C}$ is
then reduced to copper by $\mathrm{NH}_{3}$ at high temperature. Heating of $\mathbf{A}$ results also in formation of water.
a) Give formulas and names of the compounds $\mathbf{A}, \mathbf{B}$ and $\mathbf{C}$.
b) Write equations of the reactions: i) $\mathrm{CuSO}_{4}+\mathrm{NaHCO}_{3} \rightarrow$; ii) $\mathbf{A} \xrightarrow{\text { or }_{\mathrm{t}}}$; iii) $\mathrm{Ca}(\mathrm{OH})_{2}+\mathbf{B} \rightarrow$; iv) $\mathbf{B}$ (excess) $\rightarrow$; v) $\mathbf{C}+\mathrm{NH}_{3}$.
c) Calculate i) the mass of blue copperas and ii) the volume of water needed for the preparation of 27.8 g of $13.0 \%$ solution of $\mathrm{CuSO}_{4}$.
d) Calculate the volume of 1.22 M solution of $\mathrm{NaHCO}_{3}$ consumed in synthesis.
e) Calculate the yield percentage, if 2.4 g of $\mathbf{A}$ was obtained.
5. 250 ml of a solution containing $\mathrm{Ag}^{+}, \mathrm{Cu}^{2+}$ and $\mathrm{Cr}^{3+}$ ions was obtained from 2500 mg of an alloy. From $1 / 25^{\text {th }}$ part of this solution first copper and silver were eliminated, and then $\mathrm{Cr}^{3+}$ ions were oxidized to $\mathrm{CrO}_{4}^{2-}$ ions in alkali medium by hydrogen peroxide. 24.00 ml of 0.1500 M acidified solution of $\mathrm{Fe}^{2+}$ was added to the solution obtained. And 31.00 ml of 0.0196 M solution of $\mathrm{KMnO}_{4}$ was consumed in back titration $\left(5 \mathrm{Fe}^{2+} \Leftrightarrow 1 \mathrm{KMnO}_{4}\right) .9 \mathrm{~min} 35 \mathrm{sec}$ is needed to precipitate the metals from 50.00 ml of initial solution by electrolysis with the current of 2.36 A .
a) Write equations of the reactions between ions: i) $\mathrm{Cr}^{3+}+\mathrm{H}_{2} \mathrm{O}_{2}+\mathrm{OH}^{-} \rightarrow$; ii) $\mathrm{CrO}_{4}^{2-}+\mathrm{Fe}^{2+}+\mathrm{H}^{+} \rightarrow$; iii) $\mathrm{MnO}_{4}^{-}+\mathrm{Fe}^{2+}+\mathrm{H}^{+} \rightarrow$.
b) From the titration data calculate the mass of chromium contained in the alloy.
c) Calculate masses of Ag and Cu in the alloy using the mass of chromium found and the amount of electricity consumed ( $\mathrm{F}=96485 \mathrm{~A} \cdot \mathrm{~s} / \mathrm{mol}$ ).
6. The three following solution were obtained by mixing the solutions:

A: $100 \mathrm{~cm}^{3} 0.05 \mathrm{M} \mathrm{C}_{6} \mathrm{H}_{5} \mathrm{COOH}$ (benzoic acid) $+30 \mathrm{~cm}^{3} 0.08 \mathrm{M} \mathrm{NaOH}$;
B: $0.2 \mathrm{dm}^{3} 0.4 \mathrm{M} \mathrm{HCl}+0.2 \mathrm{dm}^{3} 0.5 \mathrm{M} \mathrm{NH}_{3} \cdot \mathrm{H}_{2} \mathrm{O}$;
C: $10 \mathrm{~cm}^{3} 0.4 \mathrm{M} \mathrm{HCl}+12 \mathrm{~cm}^{3} 0.4 \mathrm{M} \mathrm{NaOH}$
$\mathrm{K}_{\mathrm{A}}\left(\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{COOH}\right)=6.5 \cdot 10^{-5} \mathrm{~mol} / \mathrm{dm}^{3} ; \mathrm{K}_{\mathrm{B}}\left(\mathrm{NH}_{3} \cdot \mathrm{H}_{2} \mathrm{O}\right)=1.79 \cdot 10^{-5} \mathrm{~mol} / \mathrm{dm}^{3}$; $\mathrm{K}_{\mathrm{w}}=10^{-14} \mathrm{~mol}^{2} / \mathrm{dm}^{6}$ (usually the units are not given). The precision of initial data allows estimating of pH value with the accuracy of 0.1 units.
a) From the dissociation constant of the acid, deduce a formula for the estimation of the equilibrium concentration of hydrogen ions $\left[\mathrm{H}^{+}\right]$ contained in the solution prepared from a weak acid and its salt.
b) For the solutions $\mathbf{A}, \mathbf{B}$ and $\mathbf{C}$ : i) write equations of the reactions taking place in the solutions; ii) calculate initial and final amounts of all the compounds (except $\mathrm{H}_{2} \mathrm{O}$ ); iii) calculate pH values of the solutions.

## FORM XII

1. Compounds of the inorganic part of Estonian shale can be divided into constituents of clay-sand and carbonates. Components of the clay-sand are $\mathrm{Al}_{2} \mathrm{O}_{3}, \mathrm{~K}_{2} \mathrm{O}, \mathrm{FeS}_{2}, \mathrm{Fe}_{2} \mathrm{O}_{3}, \mathrm{H}_{2} \mathrm{O}, \mathrm{SO}_{2}$ and a component $\mathbf{X}$. The content of the latter one in the clay-sand is about $60 \%$. Components of the carbonate part are $\mathrm{CaO}-48.1 \%, \mathrm{FeO}-0.2 \%, \mathrm{CO}_{2-}-45.1 \%$ and a component $\mathbf{Y}$. Ashes from shale combustion is used for neutralization of soils and in production of cement. The smoke of the burning shale contains a compound which causes acid rains. After reaction with other products of combustion contained in the smoke and after oxidation in the air, this compound forms a solid substance which falls out onto the
surface of the ground and is identical to the congealed gypsum. Kerogen constitutes the organic part of the shale.
a) What are the name and the formula of the component $\mathbf{X}$.
b) i) Estimate the molar mass of the component $\mathbf{Y}$ and ii) give its formula and name.
c) What kind of soils needs treatment with the shale ashes and which compound improves their properties?
d) Write down two main oxides contained in cement.
e) From which parts of the shale (kerogen, clay-sand, carbonates) are three compounds formed which are initial in production of gypsum?
f) Write reactions of the formation of congealed gypsum: i) formation of acid rains; ii) its oxidation; iii) formation of gypsum.
2. When a hard binary compound A was heated with a hard simple compound $\mathbf{B}$ and a gaseous simple compound $\mathbf{C}$, a readily volatile binary five-atomic liquid compound $\mathbf{D}$ and a colourless highly toxic diatomic compound E are formed. The compound A contains $40 \%$ of oxygen and is used as a white pigment in dies. The liquid $\mathbf{D}$ is readily hydrolyzed and is used for fog imitation. If hydrolysis is complete, the compound $\mathbf{A}$ is formed. A simple compound $\mathbf{X}$ can be obtained as a result of the reaction of Mg with vapors of the compound $\mathbf{D}$. Reduction of $\mathbf{D}$ by a simple compound $\mathbf{F}$ gives HCl and a violet compound $\mathbf{G}$ (in molar ratio 1:1). When reacted with NaOH solution, the compound $\mathbf{G}$ forms an insoluble oxide-monohydrate $\mathbf{H}$. The latter is not a redox reaction. As meta- as ortho-salts can be obtained by fusion of the compound A with metal oxides or alkali.
a) Estimate the molar mass of the compound $\mathbf{A}$ and determine the simple compound $\mathbf{X}$.
b) Write formulas and names of the compounds $\mathbf{A}-\mathbf{H}$.
c) Write equations of the following reactions: i) $\mathbf{A}+\mathbf{B}+\mathbf{C} \rightarrow$; ii) $\mathbf{D}+\mathrm{H}_{2} \mathrm{O} \rightarrow$; iii) $\mathbf{D}+\mathrm{Mg} \rightarrow$; iv) $\mathbf{D}+\mathbf{F} \rightarrow$; v) $\mathbf{G}+\mathrm{NaOH} \rightarrow$; vi) $\mathbf{A}+\mathrm{CaO} \rightarrow$ metacompound (give its name); vii) $\mathbf{A}+\mathrm{NaOH} \rightarrow$ ortho-compound (give its name).
3. 176.3 mg of the compound $\mathbf{X}$ was burned in the oxygen atmosphere.

The hot products of the combustion were first passed through a hydroscopic magnesium perchlorate powder and then absorbed in a barium hydroxide solution. The mass of $\mathrm{Mg}\left(\mathrm{ClO}_{4}\right)_{2}$ increased by 216.2 mg . And 1.973 g of a white precipitate were separated from the solution of $\mathrm{Ba}(\mathrm{OH})_{2}$. An industrial production of the compound $\mathbf{X}$ is based on the reaction of $\mathbf{A}$ with $\mathbf{B}$ in the presence of an acidic catalyst. The toxic liquid
$\mathbf{A}$ is obtained by a catalytic reduction of carbon monoxide by hydrogen. If the compound $\mathbf{A}$ reacts with concentric sulfuric acid, an ester $\mathbf{C}$ with an empiric formula $\mathrm{C}_{2} \mathrm{H}_{6} \mathrm{O}_{4} \mathrm{~S}$ is formed. The compound $\boldsymbol{D}$ is formed in the reaction of $\mathbf{C}$ with potassium iodide (nucleophylic substitution). Two molecules of water combine with a molecule of the compound $\mathbf{B}$ in acidic medium forming a compound $\mathbf{E}$ which has three identical methyl groups. The compound $\mathbf{E}$ reacts with sodium forming a salt $\mathbf{F}$ with evaluation of hydrogen. As a result of the reaction of $\mathbf{C}$ with $\mathbf{F}$, the compound $\mathbf{X}$ and sodium methyl sulfate are formed.
a) Estimate the simplest empirical formula of the compound $\mathbf{X}$.
b) Write simplified structural formulas of the compounds $\mathbf{X}$ and $\mathbf{A}-\mathbf{F}$.
c) Write equations of the reactions: i) $\mathrm{CO}+\mathrm{H}_{2} \rightarrow$; ii) $\mathbf{A}+\mathrm{H}_{2} \mathrm{SO}_{4} \rightarrow$; iii) $1 \mathbf{C}+1 \mathrm{KI} \rightarrow$; iv) $1 \mathbf{B}+1 \mathrm{H}_{2} \mathrm{O} \rightarrow$; v) $\mathbf{E}+\mathrm{Na} \rightarrow$; vi) $\mathbf{C}+\mathbf{F} \rightarrow$ vii) $\mathbf{A}+\mathbf{B} \rightarrow$
4. 25.0 ml of 1.20 M solution of NaOH was consumed for neutralization of 1.71 g of a carboxylic acid (doesn't contain any other functional groups). If the same acid is heated, a compound with the carbon content of $50 \%$ is formed.
a) Estimate the molar mass of the monoprotic carboxylic acid using results of the titration.
b) Give structural formulas of three possible carboxylic acids which satisfy the results of the titration.
c) What compound is formed from a carboxylic acid under treatment with a water-retention agent?
d) Draw the planar structural formula of the compound (carbon content $50 \%$ ) which is formed by heating the carboxylic acid with the largest molar mass found in paragraph b).
5. Spontaneous decomposition of hydrogen peroxide is a first order reaction. The reaction progress is watched by determination of the amount of hydrogen peroxide left in certain intervals of time. In an acidified solution $\mathrm{H}_{2} \mathrm{O}_{2}$ reacts with $\mathrm{KMnO}_{4}$ instantly. In practice an exact volume of $\mathrm{H}_{2} \mathrm{O}_{2}$ in a certain period of time is added to a measured volume of $\mathrm{KMnO}_{4}$ solution with known concentration. Then the amount of $\mathrm{KMnO}_{4}$ reacted is determined by back titration with a solution of $\mathrm{Fe}^{2+}$. The amount of hydrogen peroxide left after spontaneous decomposition is proportional to the amount of $\mathrm{KMnO}_{4}$ consumed in the reaction (given in the table):

| Time (min) | 0 | 5 | 10 | 20 | 30 |
| :--- | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{n}\left(\mathrm{KMnO}_{4}\right)\left(\mathrm{mmol}^{\prime}\right)$ | 46.1 | 37.1 | 29.8 | 19.3 | 12.5 |

$\ln \left(\mathrm{c}_{0} / \mathrm{c}_{\mathrm{t}}\right)=\mathrm{k} \cdot \mathrm{t}$
a) Write equations of the reactions: i) $\mathrm{H}_{2} \mathrm{O}_{2}$ decomposes $\rightarrow$; ii) $\mathrm{H}_{2} \mathrm{O}_{2}+$ $\mathrm{H}_{2} \mathrm{SO}_{4}+\mathrm{KMnO}_{4} \rightarrow$; iii) $\mathrm{FeSO}_{4}+\mathrm{H}_{2} \mathrm{SO}_{4}+\mathrm{KMnO}_{4} \rightarrow$.
b) From the data given above calculate the rate constants and their average.
c) Calculate the half-life period of the reaction of decomposition of $\mathrm{H}_{2} \mathrm{O}_{2}$.
d) Calculate the amount of $\mathrm{KMnO}_{4}$ consumed in the titration of $\mathrm{H}_{2} \mathrm{O}_{2}$, if the time passed from the beginning of the reaction is 50 minutes.
6. The following processes take place on the Sun:

$$
\begin{aligned}
& { }^{1} \mathrm{H}+{ }^{1} \mathrm{H}={ }^{2} \mathrm{H}+\beta^{+}+v \\
& { }^{2} \mathrm{H}+{ }^{1} \mathrm{H}={ }^{3} \mathrm{He}+\gamma \\
& { }^{3} \mathrm{He}+{ }^{3} \mathrm{He}={ }^{4} \mathrm{He}+2^{1} \mathrm{H}
\end{aligned}
$$

where $\beta^{+}, \quad v$ and $\gamma$ are positron, neutrino and gamma-ray respectively.
a) Write the net equation of the reaction of hydrogen "combustion" on the Sun.
b) Calculate the mass defect for the formation of one atom of ${ }^{4} \mathrm{He}$.
c) Calculate i) the mass defect (kg) and ii) energy released by "combustion" of 5.000 g of hydrogen.
d) Calculate i) combustion enthalpy for 5.0 g of hydrogen; ii) how many times the energy released by "combustion" of hydrogen on the Sun exceeds energy estimated in the paragraph i).

$$
\begin{aligned}
& m\left({ }^{1} \mathrm{H}\right)=1,00727 \text { a.u.m.; } m\left({ }^{4} \mathrm{He}\right)=4,00273 \text { a.u.m.; } \\
& m\left(\beta^{+}\right)=0,0005486 \text { a.u.m.. } \\
& E=m \cdot c^{2} ; c=3,0 \cdot 10^{8} \mathrm{~m} / \mathrm{s} ; \Delta \mathrm{H}_{\mathrm{f}}^{0}\left(\mathrm{H}_{2} \mathrm{O}\right)=-286 \mathrm{~kJ} / \mathrm{mol} ;
\end{aligned}
$$

the mass of neutrino is negligibly small and gamma-ray doesn't have a mass of rest.

## Solutions

## FORM X

1. a) i) $\mathbf{A}-\mathrm{CO}_{2}$, carbon dioxide

B - $\mathrm{H}_{2}$, hydrogen
C - Na, sodium
ii) D - $\mathrm{H}_{2} \mathrm{SO}_{4}$, sulfuric acid
$\mathrm{E}-\mathrm{NH}_{3}$, ammoniac
b) The balloon filled with $\mathrm{CO}_{2}$ is safe, $\mathrm{H}_{2}$ is explosive hazardous and $\mathrm{NH}_{3}$ irritates respiration.
c) $\mathrm{M}_{\mathrm{r}}$ (air) $=29<\mathrm{M}_{\mathrm{r}}\left(\mathrm{CO}_{2}\right)=44$, falls on the floor
$M_{r}$ (air) $=29>M_{r}\left(\mathrm{H}_{2}\right)=2, \quad$ flies up to the ceiling
$M_{r}($ air $)=29>M_{r}\left(\mathrm{NH}_{3}\right)=17, \quad$ flies up to the ceiling
d) $\mathbf{F}-\mathrm{NaOH}$, sodium hydroxide
$\mathbf{G}-\mathrm{NaHCO}_{3}$, sodium bicarbonate
$\mathbf{H}-\mathrm{NH}_{4} \mathrm{HCO}_{3}$, ammonium bicarbonate
I - $\left(\mathrm{NH}_{4}\right)_{2} \mathrm{SO}_{4}$ ammonium sulfate
$\mathbf{J}-\mathrm{Na}_{2} \mathrm{SO}_{4}$, sodium sulfate

c) $\Delta \mathrm{H}\left[\mathrm{H}_{2} \mathrm{O}(\mathrm{v}) \rightarrow \mathrm{H}_{2} \mathrm{O}(\mathrm{g})\right]=-241.8 \mathrm{~kJ} / \mathrm{mol}-(-285.8 \mathrm{~kJ} / \mathrm{mol})=44.0 \mathrm{~kJ} / \mathrm{mol}$ The system receives energy; therefore the sign of $\Delta \mathrm{H}$ is positive. M(sucrose) $=342 \mathrm{~g} / \mathrm{mol}$
Energy produced by the oxidation of 1 gram of sucrose:

$$
+5643.8 \mathrm{~kJ} / \mathrm{mol} \cdot \frac{1 \mathrm{~mol}}{342 \mathrm{~g}}=16.502 \mathrm{~kJ} / \mathrm{g} \approx 16.5 \mathrm{~kJ} / \mathrm{g}
$$

Energy needed to evaporate 1 litre of water:

$$
\begin{aligned}
& +44.0 \mathrm{~kJ} / \mathrm{mol} \cdot 1000 \mathrm{~cm}^{3} \cdot 1.00 \mathrm{~g} / \mathrm{cm}^{3} \cdot \frac{\mathbf{1 m o l}}{\mathbf{1 8 . 0 g}}=2444 \mathrm{~kJ} \approx 2440 \mathrm{~kJ} \\
& \mathbf{m}(\text { sucrose })=2444 \mathrm{~kJ} \cdot \frac{\mathbf{1 g}}{\mathbf{1 6 . 5} \mathbf{k J}}=148 \mathrm{~g}
\end{aligned}
$$

## FORM XI

1. a) $n(C)=24 \underline{0} \cdot 0.82 \cdot \frac{1}{12.01}=16.38 \approx 16.4$

$$
\begin{aligned}
& n(\mathrm{O})=24 \underline{O} \cdot 0.069 \cdot \frac{1}{16.00}=1.035 \\
& n(\mathrm{H})=24 \underline{O} \cdot 0.11 \cdot \frac{1}{1.008}=26.19 \approx 26.2 \\
& \mathrm{C}_{16.4} \mathrm{O}_{1.035} \mathrm{H}_{26.2}
\end{aligned}
$$

b) The following saturated compounds correspond to the unsaturated compound:
i) $\mathrm{C}_{16} \mathrm{H}_{32} \mathrm{O}$ - ketone;
ii) $\mathrm{C}_{16} \mathrm{H}_{34} \mathrm{O}$ - alcohol.

5-methyl resorcine

5-ethyl resorcine

2,5-dimethyl resorcine
d) i)

decane
iii)

pentyl cyclohexane
iv)

1,7-oktadiene
v)

3-methyl phenole
vi)

heptane dicarboxylic acid
2. a) $X$ - C, carbon
$\mathbf{Y}$ - O, oxygen
E-CO, carbon monoxide
$\mathbf{F}-\mathrm{CO}_{2}$, carbon dioxide
b) i) If the number of oxygen atoms is two and the number of carbon atoms is three, then oxygen content is $47 \%$.

$$
n(C)=2 \cdot 16 \cdot \frac{1}{47 \%} \cdot 53 \% \cdot \frac{1}{12}=3
$$

All other combinations don't satisfy the problem.
ii) $\mathrm{O}=\mathrm{C}=\mathrm{C}=\mathrm{C}=\mathrm{O}$ (carbon has 4 bonds, oxygen -2 )
c) $\mathrm{M}(-\mathrm{COOH})=45 \mathrm{~g} / \mathrm{mol}$

If $\mathbf{D} \Leftrightarrow \mathrm{NaOH}$, then $\mathrm{m}(\mathbf{D})=2.080 \mathrm{~g} \cdot \frac{1}{0.04 \mathrm{~mol}}=52 \mathrm{~g} / \mathrm{mol}$
52-45=7
Doesn't fit because a fragment with this molar mass doesn't exist.
If $\mathbf{D} \Leftrightarrow 2 \mathrm{NaOH}$, then $\mathrm{M}(\mathbf{D})=\frac{1}{2} \cdot 2.080 \mathrm{~g} \cdot \frac{1}{0.04 \mathrm{~mol}}=104 \mathrm{~g} / \mathrm{mol}$
104-2.45=14
This molar mass corresponds to the fragment $-\mathrm{CH}_{2}-$ $\mathrm{HOOCCH}_{2} \mathrm{COOH}$
${ }^{\text {d) }} \mathrm{A}-{ }_{\mathrm{HO}}^{\mathrm{HO}} \mathrm{CO}$, süsihape
$\mathrm{H}_{2} \mathrm{CO}_{3}=\mathrm{H}_{2} \mathrm{O}+\mathrm{CO}_{2}$

B - HCOOH, formic acid
$\mathrm{HCOOH}=\mathrm{H}_{2} \mathrm{O}+\mathrm{CO}$
C - HOOCCOOH, oxalic acid
$(\mathrm{COOH})_{2}=\mathrm{H}_{2} \mathrm{O}+\mathrm{CO}+\mathrm{CO}_{2}$
D - $\mathrm{HOOCCH}_{2} \mathrm{COOH}$, propane dicarboxylic acid $\mathrm{HOOCCH}_{2} \mathrm{COOH}=2 \mathrm{H}_{2} \mathrm{O}+\mathrm{O}=\mathrm{C}=\mathrm{C}=\mathrm{C}=\mathrm{O}$
e) i) $\mathrm{CO}+\mathrm{NaOH}=\mathrm{HCOONa}$
ii) $2 \mathrm{HCOONa}=(\mathrm{COONa})_{2}+\mathrm{H}_{2}$
iii) $\mathrm{O}=\mathrm{C}=\mathrm{C}=\mathrm{C}=\mathrm{O}+2 \mathrm{CH}_{3} \mathrm{OH}=\mathrm{CH}_{3} \mathrm{OOCCH}_{2} \mathrm{COOCH}_{3}$
3. a) i) $2 \mathrm{Ca}_{3}\left(\mathrm{PO}_{4}\right)_{2}+3 \mathrm{SiO}_{2}+10 \mathrm{C}=\mathrm{P}_{4}+10 \mathrm{CO}+3 \mathrm{Ca}_{2} \mathrm{SiO}_{4}$
ii) $\mathbf{A}-\mathrm{Ca}_{3}\left(\mathrm{PO}_{4}\right)_{2}$, calcium phosphate
$B-P_{4}$, white phosphorous
C - $\mathrm{P}_{\mathrm{n}}$, red phosphorous
F - $\mathrm{PH}_{3}$, phosphine

1) Under water there is no oxygen which could oxidize phosphorous. Shining is caused by the reaction $\mathrm{P}+\mathrm{O}_{2}=\mathrm{PO}_{2}$ (partial oxidation)
2) By a twofold dilution of 2 M muriatic acid 1 M solution is obtained
$\mathrm{pH}=-\log \left[\mathrm{H}^{+}\right] \Rightarrow-\log 1 \Rightarrow-\log 10^{\circ}=0$
3) $\mathrm{P}_{4}+3 \mathrm{NaOH}+3 \mathrm{H}_{2} \mathrm{O}=3 \mathrm{NaH}_{2} \mathrm{PO}_{2}+\mathrm{PH}_{3}$
$\mathrm{P}_{2} \mathrm{H}_{4}$ is also formed in the reaction and its traces cause ignition of $\mathrm{PH}_{3}$.
4) Phosphine doesn't have base properties. However it forms phosphonium salts with a very strong (acid neutralization occurs which causes pH increase).
$\mathrm{PH}_{3}+\mathrm{HClO}_{4}=\mathrm{PH}_{4} \mathrm{ClO}_{4}$
5) $\mathrm{Ca}_{3}\left(\mathrm{PO}_{4}\right)_{2}+2 \mathrm{H}_{2} \mathrm{SO}_{4}=\mathrm{Ca}\left(\mathrm{H}_{2} \mathrm{PO}_{4}\right)_{2}+2 \mathrm{CaSO}_{4}$

A soluble fertilizer - superphospate - is obtained.
4. a) $\mathbf{A}-(\mathrm{CuOH})_{2} \mathrm{CO}_{3}$, vaskhüdroksiidkarbonaat, sest lagunemisel eraldus ka vesi.
$\mathrm{B}-\mathrm{CO}_{2}$, süsinikdioksiid
C - CuO, vask(II)oksiid
b) i) $2 \mathrm{CuSO}_{4}+4 \mathrm{NaHCO}_{3}=(\mathrm{CuOH})_{2} \mathrm{CO}_{3}+2 \mathrm{Na}_{2} \mathrm{SO}_{4}+\mathrm{H}_{2} \mathrm{O}+3 \mathrm{CO}_{2}$
ii) $(\mathrm{CuOH})_{2} \mathrm{CO}_{3} \xrightarrow{\mathrm{op}_{\mathrm{t}}} 2 \mathrm{CuO}+\mathrm{CO}_{2}+\mathrm{H}_{2} \mathrm{O}$
iii) $\mathrm{Ca}(\mathrm{OH})_{2}+\mathrm{CO}_{2}=\mathrm{CaCO}_{3}+\mathrm{H}_{2} \mathrm{O}$
iv) $\mathrm{Ca}(\mathrm{OH})_{2}+\mathrm{CO}_{2}+\mathrm{CO}_{2}=\mathrm{Ca}\left(\mathrm{HCO}_{3}\right)_{2}$
v) $3 \mathrm{CuO}+2 \mathrm{NH}_{3}=\mathrm{N}_{2}+3 \mathrm{Cu}+3 \mathrm{H}_{2} \mathrm{O}$
c) i) $0.13=\mathrm{m} \cdot \frac{160}{250} \cdot \frac{1}{27.8 \mathrm{~g}}$
$\mathrm{m}\left(\mathrm{CuSO}_{4} \cdot 5 \mathrm{H}_{2} \mathrm{O}\right)=0.13 \cdot 27.8 \mathrm{~g} \cdot \frac{250}{160}=5.646 \mathrm{~g} \approx 5.6 \mathrm{~g}$
ii) $\mathbf{m}\left(\mathrm{H}_{2} \mathrm{O}\right)=27.8 \mathrm{~g}-5.6 \mathrm{~g}=\mathbf{2 2 . 2} \mathrm{g}$
d) $\mathrm{V} \cdot 1.22 \mathrm{~mol} / \mathrm{dm}^{3} \quad 27.8 \mathrm{~g} \cdot 0.13$

$\mathrm{m}\left(\mathrm{Cu}^{2+}\right)=5 \cdot\left[1079 \mathrm{~A} \cdot \mathrm{~s}-\mathbf{Q}\left(\mathbf{A g}^{+}\right)\right] \cdot \frac{1}{2} \cdot \frac{1 \mathrm{~mol}}{96485 \mathrm{~A} \cdot \mathrm{~s}} \cdot 63.5 \mathrm{~g} / \mathrm{mol}=$
$=0.001645 \mathrm{~g} / \mathrm{A} \cdot \mathrm{s}\left[1079 \mathrm{~A} \cdot \mathrm{~s}-\mathbf{Q}\left(\mathbf{A g}^{+}\right)\right]=1.775 \mathrm{~g}-0.00165 \mathrm{~g} \mathrm{Q}\left(\mathrm{Ag}^{+}\right) / \mathrm{A} \cdot \mathrm{s}$
$2.250 \mathrm{~g}=0.00559 \mathrm{~g} / \mathrm{A} \cdot \mathrm{s} \cdot \mathbf{Q}\left(\mathrm{Ag}^{+}\right)+1.775 \mathrm{~g}-0.00165 \mathrm{~g} / \mathrm{A} \cdot \mathrm{s} \cdot \mathbf{Q}\left(\mathbf{A g}^{+}\right)$
$0.475=0.00394 \mathrm{Q}\left(\mathrm{Ag}^{+}\right) \cdot 1 / \mathrm{A} \cdot \mathrm{s}$
$Q\left(\mathrm{Ag}^{+}\right)=120.55 \mathrm{~A} \cdot \mathrm{~s} \approx 121 \mathrm{As}$
$\mathrm{Q}\left(\mathrm{Cu}^{2+}\right)=1079 \mathrm{~A} \cdot \mathrm{~s}-121 \mathrm{~A} \cdot \mathrm{~s}=958 \mathrm{~A} \cdot \mathrm{~s}$
$\mathrm{m}(\mathrm{Ag})=\mathrm{m}\left(\mathrm{Ag}^{+}\right)=5 \cdot 121 \mathrm{~A} \cdot \mathrm{~s} \cdot \frac{1 \mathrm{~mol}}{96485 \mathrm{~A} \cdot \mathrm{~s}} \cdot 108 \mathrm{~g} / \mathrm{mol}=0.677 \mathrm{~g} \approx 0.68 \mathrm{~g}$

$$
\mathrm{m}(\mathrm{Cu})=2.250-0.677=1.573 \mathrm{~g} \approx 1.57 \mathrm{~g}
$$

6. a) $\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{COOH} \rightleftharpoons \mathrm{C}_{6} \mathrm{H}_{5} \mathrm{COO}^{-}+\mathrm{H}^{+}$

$$
\mathrm{K}_{\mathrm{A}}=\frac{\left[\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{COO}^{-}\right]\left[\mathrm{H}^{+}\right]}{\left[\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{COOH}\right]}
$$

If sodium benzoate is added then
$\left[\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{COOH}\right]=\mathrm{C}_{\text {acid }} \quad$ ja $\quad\left[\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{COONa}\right]=\mathrm{C}_{\text {salt }}$
$\left[\mathrm{H}^{+}\right]=\mathrm{K}_{\mathrm{A}}=\frac{\mathrm{c}_{\text {acid }}}{\mathrm{c}_{\text {salt }}}$

## b) A

i) $\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{COOH}+\mathrm{NaOH}=\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{COONa}+\mathrm{H}_{2} \mathrm{O}$
ii) $n\left(\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{COOH}\right)=0.1 \mathrm{dm}^{3} \cdot 0.05 \mathrm{~mol} / \mathrm{dm}^{3}=0.005 \mathrm{~mol}$ $\mathrm{n}(\mathrm{NaOH})=0.03 \mathrm{dm}^{3} \cdot 0.08 \mathrm{~mol} / \mathrm{dm}^{3}=0.0024 \mathrm{~mol}$ $\mathrm{n}\left(\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{COOH}, \mathrm{final}\right)=0.005 \mathrm{~mol}-0.0024 \mathrm{~mol}=0.0026 \mathrm{~mol}$ $\mathrm{n}\left(\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{COONa}\right.$,final $)=\frac{1}{1} \cdot 0.0024 \mathrm{~mol}=0.0024 \mathrm{~mol}$ $\mathrm{n}(\mathrm{NaOH}$, final $)=\mathrm{n}\left(\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{COONa}\right.$, initial $)=0$
iii) $\left[\mathrm{H}^{+}\right]=6.5 \cdot 10^{-5} \mathrm{~mol} / \mathrm{dm}^{3} \cdot \frac{0.0026 \mathrm{~mol}}{0.0024 \mathrm{~mol}}=7.04 \cdot 10^{-5} \mathrm{~mol}$

$$
\mathrm{pH}=-\log 7.04 \cdot 10^{-5}=4.14 \approx 4.2
$$

## B

i) $\mathrm{HCl}+\mathrm{NH}_{3} \cdot \mathrm{H}_{2} \mathrm{O}=\mathrm{NH}_{4} \mathrm{Cl}+\mathrm{H}_{2} \mathrm{O}$
ii) $n(H C l)=0.2 \mathrm{dm}^{3} \cdot 0.4 \mathrm{~mol} / \mathrm{dm}^{3}=0.08 \mathrm{~mol}$

$$
\begin{aligned}
& \mathrm{n}\left(\mathrm{NH}_{3} \cdot \mathrm{H}_{2} \mathrm{O}\right)=0.25 \mathrm{dm}^{3} \cdot 0.5 \mathrm{~mol} / \mathrm{dm}^{3}=0.125 \mathrm{~mol} \\
& \mathrm{n}\left(\mathrm{NH}_{4} \mathrm{Cl}, \text { final }\right)=\frac{1}{1} \cdot 0.08 \mathrm{~mol}=0.08 \mathrm{~mol} \\
& \mathrm{n}\left(\mathrm{NH}_{3} \cdot \mathrm{H}_{2} \mathrm{O}, \text { final }\right)=0.125 \mathrm{~mol}-0.08 \mathrm{~mol}=0.045 \mathrm{~mol} \\
& \mathrm{n}(\mathrm{HCl}, \text { final })=\mathrm{n}\left(\mathrm{NH}_{4} \mathrm{Cl}, \text { initial }\right)=0
\end{aligned}
$$

iii) $\left[\mathrm{OH}^{-}\right]=1.79 \cdot 10^{-5} \cdot \frac{0.045 \mathrm{~mol}}{0.08 \mathrm{~mol}}=1.01 \cdot 10^{-5}$

$$
\mathrm{pOH}=-\log 1.01 \cdot 10^{-5}=5.0
$$

$$
\mathrm{pH}=\mathrm{K}_{\mathrm{v}}-\mathrm{pOH}=14-5.0=9,0
$$

## C

i) $\mathrm{HCl}+\mathrm{NaOH}=\mathrm{NaCl}+\mathrm{H}_{2} \mathrm{O}$
ii) $n(\mathrm{HCl})=0.01 \mathrm{dm}^{3} \cdot 0.4 \mathrm{~mol} / \mathrm{dm}^{3}=0.004 \mathrm{~mol}$
$\mathrm{n}(\mathrm{NaOH})=0.012 \mathrm{dm}^{3} \cdot 0.4 \mathrm{~mol} / \mathrm{dm}^{3}=0.0048 \mathrm{~mol}$
$\mathrm{n}(\mathrm{NaCl}$, final $)=\frac{1}{1} \cdot 0.004 \mathrm{~mol}=0.004 \mathrm{~mol}$
$\mathrm{n}(\mathrm{NaOH}$, final $)=0.0048 \mathrm{~mol}-0.004 \mathrm{~mol}=0.0008 \mathrm{~mol}$ $n(\mathrm{HCl}$, final $)=\mathrm{n}(\mathrm{NaCl}$, initial $)=0$
iii) The solution is of a strong base

$$
\begin{aligned}
& {\left[\mathrm{OH}^{-}\right]=\frac{0.0008 \mathrm{~mol}_{0}}{0.022 \mathrm{dm}^{3}}=0.03636 \mathrm{~mol} / \mathrm{dm}^{3}} \\
& \mathrm{pOH}=-\log 0.03636=1.44 \approx 1.4 \\
& \mathrm{pH}=14-1.4=12.6
\end{aligned}
$$

## FORM XII

1. a) $\mathrm{X}-\mathrm{SiO}_{2}$, silicium dioxide, sand
b) i) $\mathrm{n}\left(\mathrm{CO}_{2}\right)=45.1 \mathrm{~g} \cdot \frac{1 \mathrm{~mol}}{44.0 \mathrm{~g}}=1.025 \mathrm{~mol}$

$$
\begin{aligned}
& \mathrm{n}(\mathrm{FeO})=0.2 \mathrm{~g} \cdot \frac{1 \mathrm{~mol}}{71.9 \mathrm{~g}}=0.00278 \mathrm{~mol} \approx 0.003 \mathrm{~mol} \\
& \mathrm{n}(\mathrm{CaO})=48.1 \mathrm{~g} \cdot \frac{1 \mathrm{~mol}}{56.1 \mathrm{~g}}=0.857 \mathrm{~mol} \\
& \mathrm{n}(\mathbf{Y})=1.025 \mathrm{~mol}-0.003 \mathrm{~mol}-0.857 \mathrm{~mol}=0.165 \mathrm{~mol}
\end{aligned}
$$

$$
\mathrm{M}(\mathbf{Y})=6.6 \mathrm{~g} \cdot \frac{1}{0.165 \mathrm{~mol}}=\mathbf{4 0} \mathbf{g} / \mathrm{mol}
$$

The compound $\mathbf{Y}$ can't be $\mathrm{Me}_{2} \mathrm{O}$, because then $\mathrm{A}_{\mathrm{r}}(\mathrm{Me})=12$. As the compound $\mathbf{Y}$ is MeO , then $\mathrm{A}_{\mathrm{r}}(\mathrm{Me})=40-16=24$, which corresponds to magnesium.
ii) $\mathbf{Y}-\mathrm{MgO}$, magnesium oxide.
c) Acidic soils need treatment with shale ashes. CaO neutralizes acidity of soils.
d) CaO and $\mathrm{Al}_{2} \mathrm{O}_{3}$
e) $\mathrm{SO}_{2}$ - from kerogen and clay-sand parts
$\mathrm{H}_{2} \mathrm{O}$ - from kerogen part
CaO - from carbonate part
f) i) $\mathrm{SO}_{2}+\mathrm{H}_{2} \mathrm{O}=\mathrm{H}_{2} \mathrm{SO}_{3}$
ii) $2 \mathrm{H}_{2} \mathrm{SO}_{3}+\mathrm{O}_{2}=2 \mathrm{H}_{2} \mathrm{SO}_{4}$
iii) $\mathrm{H}_{2} \mathrm{SO}_{4}+\mathrm{CaO}+\mathrm{H}_{2} \mathrm{O}=\mathrm{CaSO}_{4} \cdot 2 \mathrm{H}_{2} \mathrm{O}$
2. a) The compound $\mathbf{A}$ should be $\mathrm{XO}_{2}$, because a five-atomic binary compound $\mathrm{XCl}_{4}$ is formed from it.

$$
\begin{aligned}
& \mathrm{M}_{r}(\mathbf{A})=16 \cdot 2 \cdot \frac{1}{0.40}=80 \\
& \mathrm{~A}_{r}(\mathbf{X})=80-32=48 \\
& \mathbf{X}-\mathrm{Ti}, \text { titanium }
\end{aligned}
$$

b) $\mathbf{A}-\mathrm{TiO}_{2}$, titanium (IV) oxide

B-C, carbon
C- $\mathrm{Cl}_{2}$, chlorine
D - TiCl4, titanium(IV) chloride

E-CO, carbon oxide
F - $\mathrm{H}_{2}$, hydrogen
G - $\mathrm{TiCl}_{3}$, titanium(III) chloride
$\mathbf{H}-\mathrm{Ti}_{2} \mathrm{O}_{3} \cdot \mathrm{H}_{2} \mathrm{O}$, titanium(III) oxide monohydrate
c) i) $\mathrm{TiO}_{2}+2 \mathrm{C}+2 \mathrm{Cl}_{2}=\mathrm{TiCl}_{4}+2 \mathrm{CO}$
ii) $\mathrm{TiCl}_{4}+2 \mathrm{H}_{2} \mathrm{O}=\mathrm{TiO}_{2}+4 \mathrm{HCl}$
iii) $\mathrm{TiCl}_{4}+2 \mathrm{Mg}=\mathrm{Ti}+2 \mathrm{MgCl}_{2}$
iv) $2 \mathrm{TiCl}_{4}+\mathrm{H}_{2}=2 \mathrm{TiCl}_{3}+2 \mathrm{HCl}$
v) $2 \mathrm{TiCl}_{3}+6 \mathrm{NaOH}=\mathrm{Ti}_{2} \mathrm{O}_{3} \cdot \mathrm{H}_{2} \mathrm{O}+6 \mathrm{NaCl}+2 \mathrm{H}_{2} \mathrm{O}$
vi) $\mathrm{TiO}_{2}+\mathrm{CaO}=\mathrm{CaTiO}_{3}$ (calcium meta-titanate)
vii) $\mathrm{TiO}_{2}+4 \mathrm{NaOH}=\mathrm{Na}_{4} \mathrm{TiO}_{4}+2 \mathrm{H}_{2} \mathrm{O}$ (sodium ortho-titanate)
3. a) $n(H) \Leftrightarrow 2 n\left(\mathrm{H}_{2} \mathrm{O}\right)$
$\mathrm{n}(\mathrm{H})=2 \cdot 216.2 \mathrm{mg} \cdot \frac{1 \mathrm{~mol}}{18.02 \mathrm{~g}}=24 \mathrm{mmol}$
$\mathrm{n}(\mathrm{C}) \Leftrightarrow \mathrm{n}\left(\mathrm{BaCO}_{3}\right)$
$\mathrm{n}(\mathrm{C})=1.973 \mathrm{~g} \cdot \frac{1 \mathrm{~mol}}{197.3 \mathrm{~g}}=10 \mathrm{mmol}$
$24 \mathrm{mmol} \cdot 1.008 \mathrm{~g} / \mathrm{mol}+10 \mathrm{mmol} \cdot 12.01 \mathrm{~g} / \mathrm{mol}=144.3 \mathrm{mg}$
$\mathrm{n}(\mathrm{O})=(176.3 \mathrm{mg}-144.3 \mathrm{mg}) \cdot \frac{1 \mathrm{~mol}}{16 \mathrm{~g}}=2 \mathrm{mmol}$
$\mathrm{C}: \mathrm{H}: \mathrm{O}=10: 24: 2$ or $5: 12: 1$, to which corresponds an empirical formula $\quad \mathbf{C}_{5} \mathbf{H}_{12} \mathbf{O}$
b) $\mathbf{X}-\left(\mathrm{CH}_{3}\right)_{3} \mathrm{COCH}_{3}$
$\mathrm{A}-\mathrm{CH}_{3} \mathrm{OH}$
B - $\left(\mathrm{CH}_{3}\right)_{2} \mathrm{C}=\mathrm{CH}_{2}$
C - $\mathrm{CH}_{3} \mathrm{OSO}_{2} \mathrm{OCH}_{3}$
D - $\mathrm{CH}_{3} \mathrm{I}$

E-( $\left.\mathrm{CH}_{3}\right)_{3} \mathrm{COH}$
F - $\left(\mathrm{CH}_{3}\right)_{3} \mathrm{CONa}$ cat
c) i) $\mathrm{CO}+2 \mathrm{H}_{2}=\mathrm{CH}_{3} \mathrm{OH}$
ii) $2 \mathrm{CH}_{3} \mathrm{OH}+\mathrm{H}_{2} \mathrm{SO}_{4}=\mathrm{CH}_{3} \mathrm{OSO}_{2} \mathrm{OCH}_{3}+2 \mathrm{H}_{2} \mathrm{O}$
iii) $\mathrm{CH}_{3} \mathrm{OSO}_{2} \mathrm{OCH}_{3}+\mathrm{KI}=\mathrm{CH}_{3} \mathrm{OSO}_{2} \mathrm{OK}+\mathrm{CH}_{3} \mathrm{I}$
iv) $1\left(\mathrm{CH}_{3}\right)_{2} \mathrm{C}=\mathrm{CH}_{2}+\mathrm{H}_{2} \mathrm{O}=\left(\mathrm{CH}_{3}\right)_{3} \mathrm{COH}$
v) $2\left(\mathrm{CH}_{3}\right)_{3} \mathrm{COH}+2 \mathrm{Na}=2\left(\mathrm{CH}_{3}\right)_{3} \mathrm{CONa}+\mathrm{H}_{2}$
vi) $\mathrm{CH}_{3} \mathrm{OSO}_{2} \mathrm{OCH}_{3}+\left(\mathrm{CH}_{3}\right)_{3} \mathrm{CONa}=\left(\mathrm{CH}_{3}\right)_{3} \mathrm{COCH}_{3}+\mathrm{CH}_{3} \mathrm{OSO}_{2} \mathrm{ONa}$ vii) $\mathrm{CH}_{3} \mathrm{OH}+\left(\mathrm{CH}_{3}\right)_{2} \mathrm{C}=\mathrm{CH}_{2}=\left(\mathrm{CH}_{3}\right)_{3} \mathrm{COCH}_{3}$
4. a) $\mathbf{M}=\frac{1.71 \mathrm{~g}}{0.025 \mathrm{dm}^{3} \cdot 1.20 \mathrm{~mol} / \mathrm{dm}^{3}}=\mathbf{5 7 . 0} \mathbf{~ g} / \mathrm{mol}$
b) The formula of a monoprotic acid is $\mathrm{R}-\mathrm{COOH}$
$\mathrm{M}(-\mathrm{COOH})=45 \mathrm{~g} / \mathrm{mol}$
$M(R)=12 \mathrm{~g} / \mathrm{mol}$
All carboxylic acids with the formula $(\mathrm{CCOOH})_{n}$ satisfy the titration data $\mathrm{n}=1$ such acid doesn't exist
$\mathrm{n}=2 \quad \mathrm{HOOCC} \equiv \mathrm{CCOOH}$
$\mathrm{n}=3$ isn't possible
$\mathrm{n}=4 \quad \mathrm{HOOC}_{\mathrm{HOOC}}^{\mathrm{HO}_{\mathrm{COOH}}^{\mathrm{COOH}}}$ or

$\mathrm{n}=5$ isn't possible
$\mathrm{n}=6$

c) An anhydride is formed by heating a carboxylic acid.
d) i) Benzene hexacarboxylic acid, as well as acids with $n=4$ and $n=2$;
ii)

$$
\mathrm{M}_{\mathrm{r}}\left(\mathrm{C}_{12} \mathrm{O}_{9}\right)=144+144=288
$$

5. a) i) $2 \mathrm{H}_{2} \mathrm{O}_{2}=2 \mathrm{H}_{2} \mathrm{O}+\mathrm{O}_{2}$
ii) $2 \mathrm{KMnO}_{4}+5 \mathrm{H}_{2} \mathrm{O}_{2}+3 \mathrm{H}_{2} \mathrm{SO}_{4}=\mathrm{K}_{2} \mathrm{SO}_{4}+2 \mathrm{MnSO}_{4}+8 \mathrm{H}_{2} \mathrm{O}+5 \mathrm{O}_{2}$
iii) $2 \mathrm{KMnO}_{4}+10 \mathrm{FeSO}_{4}+8 \mathrm{H}_{2} \mathrm{SO}_{4}=\mathrm{K}_{2} \mathrm{SO}_{4}+2 \mathrm{MnSO}_{4}$
$+5 \mathrm{Fe}_{2}\left(\mathrm{SO}_{4}\right)_{3}+8 \mathrm{H}_{2} \mathrm{O}$
b) $\mathrm{k}=\frac{1}{5 \min } \cdot \ln \frac{46.1}{37.1}=0.04344 \mathrm{~min}^{-1}$
$\mathrm{k}=\frac{1}{10 \mathrm{~min}} \cdot \ln \frac{46.1}{29.8}=0.04363 \mathrm{~min}^{-1}$
$\mathrm{k}=\frac{1}{20 \min } \cdot \ln \frac{46.1}{19.3}=0.04354 \mathrm{~min}^{-1}$
$\mathrm{k}=\frac{1}{30 \mathrm{~min}} \cdot \ln \frac{46.1}{12.5}=0.04350 \mathrm{~min}^{-1}$
$\mathrm{k}($ average $)=0.0435 \mathrm{~min}^{-1}$
c) $\tau=\frac{\ln 2}{0.0435 \min ^{-1}}=15.9 \mathrm{~min}=15 \mathrm{~min} 54 \mathrm{sec} \approx \mathbf{1 5} \mathbf{~ m i n ~} 50 \mathbf{~ s e c}$
d) $\frac{c_{o}}{c_{t}}=e^{k t} \quad \mathrm{c}_{\mathrm{t}}=\mathrm{c}_{0} \cdot \mathrm{e}^{-\mathrm{k} \cdot \mathrm{t}}$

$$
\mathrm{n}\left(\mathrm{KMnO}_{4}\right)=46.1 \mathrm{mmol} \cdot \mathrm{e}^{-0.0435 \mathrm{~min}^{-1} .50 \mathrm{~min}} \approx 5.2 \mathbf{~ m m o l}
$$

6. a) $4^{1} \mathrm{H}={ }^{4} \mathrm{He}+2 \beta^{+}+2 v+2 \gamma$
b) $\Delta \mathbf{m}=4 \mathrm{~m}\left({ }^{1} \mathrm{H}\right)-\mathrm{m}\left({ }^{4} \mathrm{He}\right)-2 \mathrm{~m}\left(\beta^{+}\right)=$

$$
=4 \cdot 1.00727-4.00273-2 \cdot 0.0005486=0.02525 \mathrm{amu}
$$

c) $\Delta \mathrm{m}=\frac{5.0 \mathrm{~g}}{1000 \mathrm{~g} / \mathrm{kg}} \cdot \frac{-0.02525 \mathrm{amü}}{4.02908 \mathrm{amü}}=-3.134 \cdot 10^{-5} \mathrm{~kg}$

$$
E=-3,134 \cdot 10^{-5} \cdot\left(3,0 \cdot 10^{8} \mathrm{~m} / \mathrm{s}\right)^{2}=-2.82 \cdot 10^{12} \mathrm{~J}
$$

d) $\mathrm{H}_{2}+1 / 2 \mathrm{O}_{2}=\mathrm{H}_{2} \mathrm{O}$

Energy released in the reaction $\frac{-286 \mathrm{~kJ} / \mathrm{mol}}{2.0 \mathrm{~g} / \mathrm{mol}} \cdot 1000 \mathrm{~J} / \mathrm{kJ} \cdot 5.0 \mathrm{~g}=-7.1 \cdot 10^{5} \mathrm{~J}$ Ratio $=\frac{-2.82 \cdot 10^{12}}{-7.1 \cdot 10^{5}}=3.9 \cdot 10^{6}$
