## Analytical Chemistry

International Chemistry Olympiad

## PROBLEM 4

A volume of $31.7 \mathrm{~cm}^{3}$ of a 0.1 -normal NaOH is required for the neutralization of 0.19 g of an organic acid whose vapour is thirty times as dense as gaseous hydrogen. Problem:
4.1 Give the name and structural formula of the acid.
(The acid concerned is a common organic acid.)

## SOLUTION

## 4.1

a) The supposed acid may be: $\mathrm{HA}, \mathrm{H}_{2} \mathrm{~A}, \mathrm{H}_{3} \mathrm{~A}$, etc.
$n(\mathrm{NaOH})=c V=0.1 \mathrm{~mol} \mathrm{dm}^{-3} \times 0.0317 \mathrm{dm}^{3}=3.17 \times 10^{-3} \mathrm{~mol}$
$n($ acid $)=\frac{3.17 \times 10^{-3}}{v} \mathrm{~mol}$
where $v=1,2,3, \ldots \ldots$
$n($ acid $)=\frac{m(\text { acid })}{M(\text { acid })}$
$M($ acid $)=v \times \frac{0.19 \mathrm{~g}}{3.17 \times 10^{-3} \mathrm{~mol}}=v \times 60 \mathrm{~g} \mathrm{~mol}^{-1}$
b) From the ideal gas law we can obtain:
$\frac{\rho_{1}}{\rho_{2}}=\frac{M_{1}}{M_{2}}$
$M\left(\mathrm{H}_{2}\right)=2 \mathrm{~g} \mathrm{~mol}^{-1}$
$M($ acid $)=30 \times 2=60 \mathrm{~g} \mathrm{~mol}^{-1}$
By comparing with (1): $v=1$
The acid concerned is a monoprotic acid and its molar mass is $60 \mathrm{~g} \mathrm{~mol}^{-1}$.
The acid is acetic acid: $\mathrm{CH}_{3}-\mathrm{COOH}$

# THE SECOND <br> INTERNATIONAL CHEMISTRY OLYMPIAD 16-20 JUNE 1969, KATOWICE, POLAND 

## THEORETICAL PROBLEMS

## PROBLEM 1

An amount of 20 g of potassium sulphate was dissolved in $150 \mathrm{~cm}^{3}$ of water. The solution was then electrolysed. After electrolysis, the content of potassium sulphate in the solution was $15 \%$ by mass.
Problem:
What volumes of hydrogen and oxygen were obtained at a temperature of $20{ }^{\circ} \mathrm{C}$ and a pressure of 101325 Pa ?

## SOLUTION

On electrolysis, only water is decomposed and the total amount of potassium sulphate in the electrolyte solution is constant. The mass of water in the solution:
1.1 Before electrolysis (on the assumption that $\rho=1 \mathrm{~g} \mathrm{~cm}^{-3}$ ): $\quad m\left(\mathrm{H}_{2} \mathrm{O}\right)=150 \mathrm{~g}$

### 1.2 After electrolysis:

$m\left(\mathrm{H}_{2} \mathrm{O}\right)=m($ solution $)-m\left(\mathrm{~K}_{2} \mathrm{SO}_{4}\right)=\frac{20 \mathrm{~g}}{0.15}-20 \mathrm{~g}=113.3 \mathrm{~g}$
The mass of water decomposed on electrolysis:
$m\left(\mathrm{H}_{2} \mathrm{O}\right)=150-113.3=36.7 \mathrm{~g}$, i. e.
$n\left(\mathrm{H}_{2} \mathrm{O}\right)=2.04 \mathrm{~mol}$
Since, $2 \mathrm{H}_{2} \mathrm{O} \rightarrow 2 \mathrm{H}_{2}+\mathrm{O}_{2}$
thus, $n\left(\mathrm{H}_{2}\right)=2.04 \mathrm{~mol}$
$n\left(\mathrm{O}_{2}\right)=1.02 \mathrm{~mol}$

$$
\begin{aligned}
& V\left(\mathrm{H}_{2}\right)=\frac{n\left(\mathrm{H}_{2}\right) R T}{p}=\frac{2.04 \mathrm{~mol} \times 8.314 \mathrm{~J} \mathrm{~mol}^{-1} \mathrm{~K}^{-1} \times 293.15 \mathrm{~K}}{101325 \mathrm{~Pa}} \\
& \approx 0.049 \mathrm{~m}^{3}, \text { resp. } 49 \mathrm{dm}^{3} \\
& V\left(\mathrm{O}_{2}\right)=1 / 2 V\left(\mathrm{H}_{2}\right) \approx 0.0245 \mathrm{~m}^{3} \approx 24.5 \mathrm{dm}^{3}
\end{aligned}
$$

## PROBLEM 3

A $10 \mathrm{~cm}^{3}$ sample of an unknown gaseous hydrocarbon was mixed with $70 \mathrm{~cm}^{3}$ of oxygen and the mixture was set on fire by means of an electric spark. When the reaction was over and water vapours were liquefied, the final volume of gases decreased to 65 $\mathrm{cm}^{3}$. This mixture then reacted with a potassium hydroxide solution and the volume of gases decreased to $45 \mathrm{~cm}^{3}$.
Problem:
What is the molecular formula of the unknown hydrocarbon if volumes of gases were measured at standard temperature and pressure (STP) conditions?

## SOLUTION

The unknown gaseous hydrocarbon has the general formula: $\mathrm{C}_{\mathrm{x}} \mathrm{H}_{\mathrm{y}}$

$$
n\left(\mathrm{C}_{\mathrm{x}} \mathrm{H}_{\mathrm{y}}\right)=\frac{0.010 \mathrm{dm}^{3}}{22.4 \mathrm{dm}^{3} \mathrm{~mol}^{-1}}=\frac{0.010}{22.4} \mathrm{~mol}
$$

Balance of oxygen:

- Before the reaction: $\quad 70 \mathrm{~cm}^{3}$, i. e. $\frac{0.070}{22.4} \mathrm{~mol}$
- After the reaction: $\quad 45 \mathrm{~cm}^{3}$, i. e. $\frac{0.045}{22.4} \mathrm{~mol}$

Consumed in the reaction: $\quad \frac{0.025}{22.4} \mathrm{~mol}$ of $\mathrm{O}_{2}$

According to the equation:
$\mathrm{C}_{x} \mathrm{H}_{\mathrm{y}}+\left(\mathrm{x}+\frac{\mathrm{y}}{4}\right) \mathrm{O}_{2}=\mathrm{xCO} \mathrm{CO}_{2}+\frac{\mathrm{y}}{2} \mathrm{H}_{2} \mathrm{O}$
Hence, $\frac{0.020}{22.4} \mathrm{~mol}$ of $\mathrm{O}_{2}$ reacted with carbon and $\frac{0.020}{22.4} \mathrm{~mol}$ of $\mathrm{CO}_{2}$ was formed $\left(\mathrm{C}+\mathrm{O}_{2}=\mathrm{CO}_{2}\right)$,
$\frac{0.005}{22.4} \mathrm{~mol} \mathrm{O}_{2}$ combined with hydrogen and $\frac{0.010}{22.4} \mathrm{~mol}$ of water was obtained $\left(2 \mathrm{H}_{2}+\mathrm{O}_{2}=2 \mathrm{H}_{2} \mathrm{O}\right)$.
$3 n(\mathrm{C})=n\left(\mathrm{CO}_{2}\right)=\frac{0.020}{22.4} \mathrm{~mol}$
$n\left(\mathrm{H}_{2}\right)=2 n\left(\mathrm{H}_{2} \mathrm{O}\right)=\frac{0.020}{22.4} \mathrm{~mol}$
$\mathrm{x}: \mathrm{y}=n(\mathrm{C}): n\left(\mathrm{H}_{2}\right)=0.020: 0.020=1: 1$
From the possible solutions $\mathrm{C}_{2} \mathrm{H}_{2}, \mathrm{C}_{3} \mathrm{H}_{3}, \mathrm{C}_{4} \mathrm{H}_{4}, \mathrm{C}_{5} \mathrm{H}_{5}$. only $\mathrm{C}_{2} \mathrm{H}_{2}$ satisfies to the conditions given in the task, i. e. the unknown hydrocarbon is acetylene.

## PROBLEM 2

A sample of crystalline soda (A) with a mass of 1.287 g was allowed to react with an excess of hydrochloric acid and $100.8 \mathrm{~cm}^{3}$ of a gas was liberated (measured at STP).

Another sample of different crystalline soda (B) with a mass of 0.715 g was decomposed by $50 \mathrm{~cm}^{3}$ of 0.2 N sulphuric acid.

After total decomposition of soda, the excess of the sulphuric acid was neutralized which required $50 \mathrm{~cm}^{3}$ of 0.1 N sodium hydroxide solution (by titration on methyl orange indicator).

## Problems:

2.1 How many molecules of water in relation to one molecule of $\mathrm{Na}_{2} \mathrm{CO}_{3}$ are contained in the first sample of soda?
2.2 Have both samples of soda the same composition?

Relative atomic masses: $\quad A_{r}(\mathrm{Na})=23 ; \quad A_{r}(\mathrm{H})=1 ; \quad A_{r}(\mathrm{C})=12 ; \quad A_{r}(\mathrm{O})=16$.

## SOLUTION

2.1 Sample A: $\quad \mathrm{Na}_{2} \mathrm{CO}_{3} . \times \mathrm{H}_{2} \mathrm{O}$
$m(\mathrm{~A})=1.287 \mathrm{~g}$
$n\left(\mathrm{CO}_{2}\right)=\frac{p V}{R T}=0.0045 \mathrm{~mol}=n(\mathrm{~A})$
$M(\mathrm{~A})=\frac{1.287 \mathrm{~g}}{0.0045 \mathrm{~mol}}=286 \mathrm{~g} \mathrm{~mol}^{-1}$
$M(\mathrm{~A})=M\left(\mathrm{Na}_{2} \mathrm{CO}_{3}\right)+\mathrm{x} M\left(\mathrm{H}_{2} \mathrm{O}\right)$
$\mathrm{x}=\frac{M(\mathrm{~A})-M\left(\mathrm{Na}_{2} \mathrm{CO}_{3}\right)}{M\left(\mathrm{H}_{2} \mathrm{O}\right)}=\frac{(286-106) \mathrm{g} \mathrm{mol}^{-1}}{18 \mathrm{~g} \mathrm{~mol}^{-1}}=10$

Sample A: $\mathrm{Na}_{2} \mathrm{CO}_{3} .10 \mathrm{H}_{2} \mathrm{O}$
2.2 Sample B: $\mathrm{Na}_{2} \mathrm{CO}_{3} . \times \mathrm{H}_{2} \mathrm{O}$
$m(B)=0.715 \mathrm{~g}$
$\mathrm{H}_{2} \mathrm{SO}_{4}+2 \mathrm{NaOH}=\mathrm{Na}_{2} \mathrm{SO}_{4}+2 \mathrm{H}_{2} \mathrm{O}$
$n(\mathrm{NaOH})=c V=0.1 \mathrm{~mol} \mathrm{dm}^{-3} \times 0.05 \mathrm{dm}^{3}=0.005 \mathrm{~mol}$
Excess of $\mathrm{H}_{2} \mathrm{SO}_{4}: n\left(\mathrm{H}_{2} \mathrm{SO}_{4}\right)=0.0025 \mathrm{~mol}$
Amount of substance combined with sample B:
$n\left(\mathrm{H}_{2} \mathrm{SO}_{4}\right)=0.0025 \mathrm{~mol}=n(\mathrm{~B})$
$M(\mathrm{~B})=\frac{0.715 \mathrm{~g}}{0.0025 \mathrm{~g} \mathrm{~mol}^{-1}}=286 \mathrm{~g} \mathrm{~mol}^{-1}$

Sample B: $\mathrm{Na}_{2} \mathrm{CO}_{3} .10 \mathrm{H}_{2} \mathrm{O}$

## PROBLEM 4

An alloy consists of rubidium and one of the other alkali metals. A sample of 4.6 g of the alloy when allowed to react with water, liberates $2.241 \mathrm{dm}^{3}$ of hydrogen at STP.

## Problems:

4.1 Which alkali metal is the component of the alloy?
4.2 What composition in \% by mass has the alloy?

Relative atomic masses:
$A_{r}(\mathrm{Li})=7 ; \quad A_{r}(\mathrm{Na})=23 ; \quad A_{r}(\mathrm{~K})=39 ; \quad A_{r}(\mathrm{Rb})=85.5 ; \quad A_{r}(\mathrm{Cs})=133$

## SOLUTION

4.1 M - alkali metal

Reaction: $2 \mathrm{M}+2 \mathrm{H}_{2} \mathrm{O} \rightarrow 2 \mathrm{MOH}+\mathrm{H}_{2}$
$n\left(\mathrm{H}_{2}\right)=0.1 \mathrm{~mol}$
$n(\mathrm{M})=0.2 \mathrm{~mol}$
Mean molar mass:
$M=\frac{4.6 \mathrm{~g}}{0.2 \mathrm{~mol}}=23 \mathrm{~g} \mathrm{~mol}^{-1}$
4.2 Concerning the molar masses of alkali metals, only lithium can come into consideration, i.e. the alloy consists of rubidium and lithium.
$n(\mathrm{Rb})+n(\mathrm{Li})=0.2 \mathrm{~mol}$
$m(\mathrm{Rb})+m(\mathrm{Li})=4.6 \mathrm{~g}$
$n(\mathrm{Rb}) M(\mathrm{Rb})+n(\mathrm{Li}) M(\mathrm{Li})=4.6 \mathrm{~g}$
$n(\mathrm{Rb}) M(\mathrm{Rb})+(0.2-n(\mathrm{Rb})) M(\mathrm{Li})=4.6$
$n(R b) .85 .5+(0.2-n(R b)) \times 7=4.6$
$n(\mathrm{Rb})=0.0408 \mathrm{~mol}$
$n(\mathrm{Li})=0.1592 \mathrm{~mol}$
$\% \mathrm{Rb}=\frac{0.0408 \mathrm{~mol} \times 85.5 \mathrm{~g} \mathrm{~mol}^{-1}}{4.6 \mathrm{~g}} \times 100=76$

$$
\% \mathrm{Li}=\frac{0.1592 \mathrm{~mol} \times 7 \mathrm{~g} \mathrm{~mol}^{-1}}{4.6 \mathrm{~g}} \times 100=24
$$

## PROBLEM 3

A volume of $200 \mathrm{~cm}^{3}$ of a 2-normal sodium chloride solution $\left(\rho=1.10 \mathrm{~g} \mathrm{~cm}^{-3}\right)$ was electrolysed at permanent stirring in an electrolytic cell with copper electrodes. Electrolysis was stopped when $22.4 \mathrm{dm}^{3}$ (at STP) of a gas were liberated at the cathode.

## Problem:

3.1 Calculate the mass percentage of NaCl in the solution after electrolysis.

Relative atomic masses:

$$
A_{r}(\mathrm{H})=1 ; \quad A_{r}(\mathrm{O})=16 ; \quad A_{r}(\mathrm{Na})=23 ; \quad A_{r}(\mathrm{Cl})=35.5 ; \quad A_{\mathrm{r}}(\mathrm{Cu})=64 .
$$

## SOLUTION

3.1 Calculations are made on the assumption that the following reactions take place:
$2 \mathrm{NaCl} \rightarrow 2 \mathrm{Na}^{+}+2 \mathrm{Cl}^{-}$
cathode: $2 \mathrm{Na}^{+}+2 \mathrm{e}^{-} \rightarrow 2 \mathrm{Na}$
anode: $\quad 2 \mathrm{Cl}^{-}-2 \mathrm{e}^{-} \rightarrow \mathrm{Cl}^{-}$

$$
\mathrm{Cl}_{2}+\mathrm{Cu} \rightarrow \mathrm{CuCl}_{2}
$$

Because the electrolyte solution is permanently being stirred the following reaction comes into consideration:
$\mathrm{CuCl}_{2}+2 \mathrm{NaOH} \rightarrow \mathrm{Cu}(\mathrm{OH})_{2}+2 \mathrm{NaCl}$
On the assumption that all chlorine reacts with copper, the mass of NaCl in the electrolyte solution remains unchanged during the electrolysis.
$m(\mathrm{NaCl})=n M=c V M=2 \mathrm{~mol} \mathrm{dm}^{-3} \times 0.2 \mathrm{dm}^{3} \times 58.5 \mathrm{~g} \mathrm{~mol}^{-1}=23.4 \mathrm{~g}$
$V\left(\mathrm{H}_{2}\right)=22.4 \mathrm{dm}^{3}$, i. e. $\mathrm{n}\left(\mathrm{H}_{2}\right)=1 \mathrm{~mol}$
The amount of water is decreased in the solution by:
$n\left(\mathrm{H}_{2} \mathrm{O}\right)=2 \mathrm{~mol}$
$m\left(\mathrm{H}_{2} \mathrm{O}\right)=36 \mathrm{~g}$
Before electrolysis:
$m($ solution NaCl$)=V \rho=200 \mathrm{~cm}^{3} \times 1.10 \mathrm{~g} \mathrm{~cm}^{-3}=220 \mathrm{~g}$
$\% \mathrm{NaCl}=\frac{23.4 \mathrm{~g}}{220 \mathrm{~g}} \times 100=10.64$

After electrolysis:
$m($ solution NaCl$)=220 \mathrm{~g}-36 \mathrm{~g}=184 \mathrm{~g}$
$\% \mathrm{NaCl}=\frac{23.4 \mathrm{~g}}{184 \mathrm{~g}} \times 100=12.72$

## PROBLEM 3

Equal volumes $\left(10 \mathrm{~cm}^{3}\right)$ of 0.01-molar solutions of $\mathrm{CH}_{3} \mathrm{COOH}$ and HClO were mixed and then diluted to a total volume of $100 \mathrm{~cm}^{3}$. Ionisation constant of $\mathrm{CH}_{3} \mathrm{COOH}$ is equal to $1.8 \times 10^{-5}$ and that for HClO is $3,7 \times 10^{-8}$.

## Problems:

Calculate:
3.1 degree of ionisation for each of the acids in the solution,
3.2 degree of ionisation of HClO if the diluted solution would not contain $\mathrm{CH}_{3} \mathrm{COOH}$,
3.3 pH value for the solution containing at the same time $\mathrm{CH}_{3} \mathrm{COOH}$ and HClO .

## SOLUTION

$\mathrm{CH}_{3} \mathrm{COOH}: \quad K_{1}, \alpha_{1}, c_{1}$
HCIO: $K_{2}, \alpha_{2}, c_{2}$
$c_{1}=c_{2}=1 \times 10^{-3} \mathrm{~mol} \mathrm{dm}^{-3}=c$
$3.1 K_{1}=\frac{\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]\left[\mathrm{CH}_{3} \mathrm{COO}^{-}\right]}{\left[\mathrm{CH}_{3} \mathrm{COOH}\right]}=\frac{\left(\alpha_{1}+\alpha_{2}\right) c \times \alpha_{1} c}{\left(1-\alpha_{1}\right) c}=\frac{\left(\alpha_{1}+\alpha_{2}\right) \alpha_{1} c}{1-\alpha_{1}}$
$K_{2}=\frac{\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]\left[\mathrm{ClO}^{-}\right]}{[\mathrm{HClO}]}=\frac{\left(\alpha_{1}+\alpha_{2}\right) \alpha_{1} c}{1-\alpha_{2}}$
$K_{1} \gg K_{2}$, therefore also $\alpha_{1} \gg \alpha_{2}$ and $\alpha_{1}+\alpha_{2} \approx \alpha_{1}$

$$
\begin{aligned}
K_{1}\left(1-\alpha_{1}\right) & =\alpha_{1}^{2} c \\
c \alpha_{1}^{2}+K_{1} \alpha_{1}-K_{1} & =0 \\
\alpha_{1} & =0,125
\end{aligned}
$$

When (2) is divided by (1):
$\frac{K_{2}}{K_{1}}=\frac{\left(1-\alpha_{1}\right) \alpha_{2}}{\left(1-\alpha_{2}\right) \alpha_{1}}$
After substitution of $\alpha_{1}: \alpha_{2}=2.94 \cdot 10^{-4}$
3.2 $K_{2}=\frac{\alpha_{2}^{2} c}{1-\alpha_{2}}$
$\alpha_{2} \ll 1$
$K_{2}=\alpha_{2}^{2} c$
$\alpha_{2}=6,08 \cdot 10^{-3}$
$3.3\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=\alpha_{1} c+\alpha_{2} C=\left(\alpha_{1}+\alpha_{2}\right) c=\left(0,125+2,94 \times 10^{-4}\right) \times 10^{-3} \approx 1,25 \times 10^{-4} \mathrm{~mol} \mathrm{dm}^{-3}$ $\mathrm{pH}=3,9$

## PROBLEM 3

The following 0.2 molar solutions are available:
A: HCl
B: $\mathrm{HSO}_{4}^{-}$
C: $\mathrm{CH}_{3} \mathrm{COOH}$
D: NaOH
E: $\quad \mathrm{CO}_{3}^{2-}$
F: $\quad \mathrm{CH}_{3} \mathrm{COONa}$
G: $\quad \mathrm{HPO}_{4}^{2-}$
H: $\quad \mathrm{H}_{2} \mathrm{SO}_{4}$

## Problems:

1. Determine the concentration of $\mathrm{H}_{3} \mathrm{O}^{+}$ions in solution $\mathbf{C}$.
2. Determine $\mathbf{p H}$ value in solution $\mathbf{A}$.
3. Write an equation for the chemical reaction that takes place when substances $\mathbf{B}$ and E are allowed to react and mark conjugate acid-base pairs.
4. Compare acid-base properties of substances $\mathbf{A}, \mathbf{B}$, and $\mathbf{C}$ and determine which one will show the most basic properties. Explain your decision.
5. Write a chemical equation for the reaction between substances $\mathbf{B}$ and $\mathbf{G}$, and explain the shift of equilibrium.
6. Write a chemical equation for the reaction between substances $\mathbf{C}$ and $\mathbf{E}$, and explain the shift of equilibrium.
7. Calculate the volume of $\mathbf{D}$ solution which is required to neutralise $20.0 \mathrm{~cm}^{3}$ of $\mathbf{H}$ solution.
8. What would be the volume of hydrogen chloride being present in one litre of $\mathbf{A}$ solution if it were in gaseous state at a pressure of 202.65 kPa and a temperature of $37{ }^{\circ} \mathrm{C}$ ?

Ionisation constants:
$\mathrm{CH}_{3} \mathrm{COOH}+\mathrm{H}_{2} \mathrm{O} \rightleftharpoons \mathrm{CH}_{3} \mathrm{COO}^{-}+\mathrm{H}_{3} \mathrm{O}^{+}$

$$
\mathrm{H}_{2} \mathrm{CO}_{3}+\mathrm{H}_{2} \mathrm{O} \rightleftharpoons \mathrm{HCO}_{3}^{-}+\mathrm{H}_{3} \mathrm{O}^{+}
$$

$$
\mathrm{HCO}_{3}^{-}+\mathrm{H}_{2} \mathrm{O} \rightleftharpoons \mathrm{CO}_{3}^{2-}+\mathrm{H}_{3} \mathrm{O}^{+}
$$

$$
\mathrm{HSO}_{4}^{2-}+\mathrm{H}_{2} \mathrm{O} \rightleftharpoons \mathrm{SO}_{4}^{2-}+\mathrm{H}_{3} \mathrm{O}^{+}
$$

$$
\mathrm{HPO}_{4}^{2-}+\mathrm{H}_{2} \mathrm{O} \rightleftharpoons \mathrm{PO}_{4}^{3-}+\mathrm{H}_{3} \mathrm{O}^{+}
$$

$$
\begin{aligned}
& K_{\mathrm{a}}=1.8 \times 10^{-5} \\
& K_{\mathrm{a}}=4.4 \times 10^{-7} \\
& K_{\mathrm{a}}=4.7 \times 10^{-11} \\
& K_{\mathrm{a}}=1.7 \times 10^{-2} \\
& K_{\mathrm{a}}=4.4 \times 10^{-13}
\end{aligned}
$$

Relative atomic masses:
$A_{r}(\mathrm{Na})=23 ; \quad A_{r}(\mathrm{~S})=32 ; \quad A_{\mathrm{r}}(\mathrm{O})=16$.

## SOLUTION

1. $\mathrm{CH}_{3} \mathrm{COOH}+\mathrm{H}_{2} \mathrm{O} \rightleftharpoons \mathrm{CH}_{3} \mathrm{COO}^{-}+\mathrm{H}_{3} \mathrm{O}^{+}$
$K_{a}=\frac{\left[\mathrm{CH}_{3} \mathrm{COO}^{-}\right]\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]}{\left[\mathrm{CH}_{3} \mathrm{COOH}\right]}=\frac{\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]^{2}}{c}$
$\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=\sqrt{K_{a} c}=\sqrt{1.8 \times 10^{-5} \times 0.2}=1.9 \times 10^{-3} \mathrm{~mol} \mathrm{dm}^{-3}$
2. $\mathrm{pH}=-\log \left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=-\log 0.2=0.7$
3. $\begin{aligned} \mathrm{HSO}_{4}^{2-}+\mathrm{CO}_{3}^{2-} & \stackrel{\mathrm{SO}_{4}^{2-}}{\rightleftharpoons}+\mathrm{HCO}_{3}^{-} \\ \mathrm{A}_{1} & \mathrm{~B}_{2} \\ \mathrm{~B}_{1} & \mathrm{~A}_{2}\end{aligned}$
4. By comparison of the ionisation constants we get:
$K_{\mathrm{a}}(\mathrm{HCl})>K_{\mathrm{a}}\left(\mathrm{HSO}_{4}^{-}\right)>K_{\mathrm{a}}\left(\mathrm{CH}_{3} \mathrm{COOH}\right)$
Thus, the strength of the acids in relation to water decreases in the above given order.
$\mathrm{CH}_{3} \mathrm{COO}^{-}$is the strongest conjugate base, whereas $\mathrm{Cl}^{-}$is the weakest one.
5. $\mathrm{HSO}_{4}^{-}+\mathrm{HPO}_{4}^{2-} \rightleftharpoons \mathrm{H}_{2} \mathrm{PO}_{4}^{-}+\mathrm{SO}_{4}^{2-}$
$K_{a}\left(\mathrm{HSO}_{4}^{-}\right) \gg K_{a}\left(\mathrm{HPO}_{4}^{2-}\right)$
Equilibrium is shifted to the formation of $\mathrm{H}_{2} \mathrm{PO}_{4}^{-}$and $\mathrm{SO}_{4}^{2-}$.
6. $\mathrm{CH}_{3} \mathrm{COOH}+\mathrm{CO}_{3}^{2-} \rightleftharpoons \mathrm{CH}_{3} \mathrm{COO}^{-}+\mathrm{HCO}_{3}^{-}$
$\mathrm{CH}_{3} \mathrm{COO}^{-}+\mathrm{HCO}_{3}^{-} \rightleftharpoons \mathrm{CH}_{3} \mathrm{COO}^{-}+\mathrm{H}_{2} \mathrm{CO}_{3}$
$K_{a}\left(\mathrm{CH}_{3} \mathrm{COOH}\right)>K_{\mathrm{a}}\left(\mathrm{H}_{2} \mathrm{CO}_{3}\right)>K_{\mathrm{a}}\left(\mathrm{HCO}_{3}^{-}\right)$
Equilibrium is shifted to the formation of $\mathrm{CH}_{3} \mathrm{COO}^{-}$a $\mathrm{H}_{2} \mathrm{CO}_{3}$.
7. $n\left(\mathrm{H}_{2} \mathrm{SO}_{4}\right)=c V=0.2 \mathrm{~mol} \mathrm{dm}^{-3} \times 0.02 \mathrm{dm}^{3}=0.004 \mathrm{~mol}$
$V(0.2$ molar NaOH$)=\frac{n}{c}=\frac{0.008 \mathrm{~mol}}{0.2 \mathrm{~mol} \mathrm{dm}^{-3}}=0.04 \mathrm{dm}^{3}$
8. $\quad V(\mathrm{HCl})=\frac{n R T}{p}=\frac{0.2 \mathrm{~mol} \times 8.314 \mathrm{~J} \mathrm{~mol}^{-1} \mathrm{~K}^{-1} \times 310 \mathrm{~K}}{202.65 \mathrm{kPa}}=2.544 \mathrm{dm}^{3}$

## PROBLEM 2

An alloy prepared for experimental purposes contains aluminium, zinc, silicon, and copper. If 1000 mg of the alloy are dissolved in hydrochloric acid, $843 \mathrm{~cm}^{3}$ of hydrogen $\left(0^{\circ} \mathrm{C}, 101.325 \mathrm{kPa}\right)$ are evolved and 170 mg of an undissolved residue remain. A sample of 500 mg of the alloy when reacted with a NaOH solution produces $517 \mathrm{~cm}^{3}$ of hydrogen at the above conditions and in this case remains also an undissolved fraction.

## Problem:

2.1 Calculate the composition of the alloy in \% by mass.

Relative atomic masses:

$$
A_{r}(\mathrm{Al})=26.98 ; \quad A_{r}(\mathrm{Zn})=65.37 ; \quad A_{r}(\mathrm{Si})=28.09 ; \quad A_{r}(\mathrm{Cu})=63.55 .
$$

## SOLUTION

$\begin{array}{ll}2.1 \begin{array}{ll}\mathrm{HCl} \text { dissolves: } & \mathrm{Al}, \mathrm{Zn} \\ \mathrm{NaOH} \text { dissolves: } \quad \mathrm{Al}, \mathrm{Zn}, \mathrm{Si}\end{array} \\ \begin{array}{l}\frac{0.843 \mathrm{dm}^{3}}{22.414 \mathrm{dm}^{3} \mathrm{~mol}^{-1}}=\end{array}=37.61 \mathrm{mmol} \mathrm{H}_{2} & \text { (Al, } \mathrm{Zn}) \\ \frac{2 \times 0.517 \mathrm{dm}^{3}}{22.414 \mathrm{dm}^{3} \mathrm{~mol}^{-1}}=46.13 \mathrm{mmol} \mathrm{H}_{2} & \text { (Al, } \mathrm{Zn}, \mathrm{Si})\end{array}$
The difference of 8.52 mmol H corresponds to 4.26 mmol Si

Si: $\quad m(\mathrm{Si})=4.26 \mathrm{mmol} \times 28.09 \mathrm{~g} \mathrm{~mol}^{-1}=119.7 \mathrm{mg}$
$\%$ Si $=\frac{119.7 \mathrm{mg}}{1000 \mathrm{mg}} \times 100=11.97$

Cu: $m(\mathrm{Si}+\mathrm{Cu})=170 \mathrm{mg}$
$m(\mathrm{Cu})=170 \mathrm{mg}-119.7 \mathrm{mg}=50.3 \mathrm{mg}$ (in 1000 mg of the alloy)
$\% \mathrm{Cu}=5.03$

Al: $\quad m(\mathrm{Zn}+\mathrm{Al})=1000 \mathrm{mg}-170 \mathrm{mg}=830 \mathrm{mg}$ $x \mathrm{mg} \mathrm{Al} \quad$ gives $\quad \frac{3}{2} \times \frac{\mathrm{x}}{26.98} \mathrm{mmol} \mathrm{H}_{2}$ $(830-x) \mathrm{mg} \mathrm{Zn}$ gives $\frac{830-\mathrm{x}}{65.37} \mathrm{mmol} \mathrm{H}_{2}$
$\frac{3}{2} \times \frac{x}{26.98}+\frac{830-x}{65.37}=37.61 \mathrm{mmol} \mathrm{H}_{2}$
$x=618.2 \mathrm{mg} \mathrm{Al} \quad$ (in 1000 mg of the alloy)
$\% \mathrm{Al}=61.82$

Zn: $\quad m(\mathrm{Zn})=830 \mathrm{mg}-618.2 \mathrm{mg}=211.8 \mathrm{mg}$ (in 1000 mg of the alloy)
$\% Z n=21.18$

## PROBLEM 3

A sample of 1500 mg of an alloy that contains silver, copper, and chromium is dissolved and the solution containing $\mathrm{Ag}^{+}, \mathrm{Cu}^{2+}$, and $\mathrm{Cr}^{3+}$ ions, is diluted to exactly 500 $\mathrm{cm}^{3}$. One tenth of the volume of that solution is taken for further procedure:

After elimination of silver and copper, chromium is oxidised in it according to the following unbalanced equation:

$$
\mathrm{OH}^{-}+\mathrm{Cr}^{3+}+\mathrm{H}_{2} \mathrm{O}_{2} \rightarrow \mathrm{CrO}_{4}^{2-}+\mathrm{H}_{2} \mathrm{O}
$$

Then $25.00 \mathrm{~cm}^{3}$ of a 0.100 molar Fe (II) salt solution are added. The following reaction (written in an unbalanced form) is taking place:

$$
\mathrm{H}^{+}+\mathrm{Fe}^{2+}+\mathrm{CrO}_{4}^{2-} \rightarrow \mathrm{Fe}^{3+}+\mathrm{Cr}^{3+}+\mathrm{H}_{2} \mathrm{O}
$$

According to the unbalanced equation:

$$
\mathrm{H}^{+}+\mathrm{Fe}^{2+}+\mathrm{MnO}_{4}^{-} \rightarrow \mathrm{Fe}^{3+}+\mathrm{Mn}^{2+}+\mathrm{H}_{2} \mathrm{O}
$$

a volume of $17.20 \mathrm{~cm}^{3}$ of a 0.020 -molar $\mathrm{KMnO}_{4}$ solution is required for an oxidation of the $\mathrm{Fe}(\mathrm{II})$ salt which remains unoxidized in the solution.

In another experiment, a volume of $200 \mathrm{~cm}^{3}$ of the initial solution is electrolysed. Due to secondary reactions, the efficiency of the electrolysis is $90 \%$ for metals under consideration. All three metals are quantitatively deposited in 14.50 minutes by passing a current of 2 A through the solution.

## Problem:

3.1 Balance the three chemical equations and calculate the composition of the alloy in \% by mass.

Relative atomic masses: $A_{\mathrm{r}}(\mathrm{Cu})=63.55 ; \quad A_{\mathrm{r}}(\mathrm{Ag})=107.87 ; \quad A_{\mathrm{r}}(\mathrm{Cr})=52.00$

## SOLUTION

### 3.1 Equations:

$10 \mathrm{OH}^{-}+2 \mathrm{Cr}^{3+}+3 \mathrm{H}_{2} \mathrm{O}_{2} \rightarrow 2 \mathrm{CrO}_{4}^{2-}+8 \mathrm{H}_{2} \mathrm{O}$
$8 \mathrm{H}^{+}+3 \mathrm{Fe}^{2+}+\mathrm{CrO}_{4}^{2-} \rightarrow 3 \mathrm{Fe}^{3+}+\mathrm{Cr}^{3+}+4 \mathrm{H}_{2} \mathrm{O}$
$8 \mathrm{H}^{+}+5 \mathrm{Fe}^{2+}+\mathrm{MnO}_{4}^{-} \rightarrow 5 \mathrm{Fe}^{3+}+\mathrm{Mn}^{2+}+4 \mathrm{H}_{2} \mathrm{O}$

## Content of Cr:

$17.20 \times 0.020=0.344 \mathrm{mmol} \mathrm{KMnO}_{4}$
$5 \times 0.344=1.72 \mathrm{mmol} \mathrm{Fe}^{2+}$
Reacted: $25 \times 0.1-1.72=0.78 \mathrm{mmol} \mathrm{Fe}{ }^{2+}$
It corresponds:
$\frac{0.78}{3}=0.26 \mathrm{mmol} \mathrm{Cr}$ in 150 mg of the alloy
$m(\mathrm{Cr})=2.6 \mathrm{mmol} \times 52 \mathrm{~g} \mathrm{~mol}^{-1}=135.2 \mathrm{mg}$ in 1500 mg of the alloy
$\% \mathrm{Cr}=9.013$

Content of Cu and Ag :

$$
\begin{array}{ll}
Q=40.575 \mathrm{mF} / 1500 \mathrm{mg} & (1087.4 \mathrm{mAh}) \\
Q_{\mathrm{Cr}}=2.6 \times 3=7.8 \mathrm{mF} \\
Q_{(\mathrm{Cu}+\mathrm{Ag})}=40.575-7.8=32.775 \mathrm{mF} & (209 \mathrm{mAh}) \\
(F=\text { Faraday's charge }) & (878.4 \mathrm{mAh}) \\
m(\mathrm{Cu}+\mathrm{Ag})=m(\text { alloy })-m(\mathrm{Cr})=1500-135.2=1364.8 \mathrm{mg}
\end{array}
$$

For deposition of copper: $\quad \frac{2 \mathrm{x}}{63.55} \mathrm{mF}$
For deposition of silver: $\quad \frac{1364.8-x}{107.87} \mathrm{mF}$
$32.775=\frac{2 x}{63.55}+\frac{1364.8-x}{107.87}$
$x=906.26$
$m(\mathrm{Cu})=906.26 \mathrm{mg}$ in 1500 mg of the alloy
$m(\mathrm{Ag})=458.54 \mathrm{mg}$ in 1500 mg of the alloy
\% $\mathrm{Cu}=60.4 \quad$ \% $\mathrm{Ag}=30.6$

## PROBLEM 4

The pH value of a solution containing $3 \%$ by mass of formic acid $\left(\rho=1.0049 \mathrm{~g} \mathrm{~cm}^{-}\right.$ ${ }^{3}$ ) is equal to 1.97.

Problem:
4.1 How many times should the solution be diluted to attain a tenfold increase in the value of ionisation degree?
Relative atomic masses: $A_{r}(\mathrm{H})=1.01 ; \quad A_{r}(\mathrm{C})=12.01 ; \quad A_{r}(\mathrm{O})=16$.

## SOLUTION

$4.1 \quad c_{1}=\frac{n_{1}}{V}=\frac{\frac{1004.9 \mathrm{~g} \mathrm{x} 0.03}{45.03 \mathrm{~g} \mathrm{~mol}^{-1}}}{1 \mathrm{dm}^{3}}=6.55 \times 10^{-1} \mathrm{~mol} \mathrm{dm}^{-3}$
$p H=1.97 ;\left[H^{+}\right]=1.0715 \times 10^{-2} \mathrm{~mol} \mathrm{dm}^{-3}$
$\alpha_{1}=\frac{\left[\mathrm{H}^{+}\right]}{c_{1}}=0.01636$

Calculation of $C_{2}$ after dilution (two alternative solutions):
a) $\quad \alpha_{1}$ - before dilution; $\quad \alpha_{2}-$ after dilution

$$
\begin{align*}
& K_{a}=\frac{\alpha_{1} c_{1}}{1-c_{1}}  \tag{1}\\
& K_{a}=\frac{\alpha_{2}^{2} c_{2}}{1-\alpha_{2}}=\frac{\left(10 \alpha_{1}\right)^{2} c_{2}}{1-10 \alpha_{1}} \tag{2}
\end{align*}
$$

From equations (1) and (2):

$$
\frac{c_{1}}{c_{2}}=\frac{100\left(1-\alpha_{1}\right)}{1-10 \alpha_{1}}=117.6
$$

b) $\quad K_{a}=\frac{\left[\mathrm{H}^{+}\right]^{2}}{c-\left[\mathrm{H}^{+}\right]}=\frac{\left(1.0715 \times 10^{-4}\right)^{2}}{0.655-1.0715 \times 10^{-2}}=1.78 \times 10^{-4}$

$$
\begin{aligned}
& c_{2}=\frac{K_{a}\left(1-10 \alpha_{1}\right)}{\left(10 \alpha_{1}\right)^{2}}=5.56 \times 10^{-3} \mathrm{~mol} \mathrm{dm}^{-3} \\
& \frac{c_{1}}{c_{2}}=\frac{6.55 \times 10^{-1} \mathrm{~mol} \mathrm{dm}^{-3}}{5.56 \times 10^{-3} \mathrm{~mol} \mathrm{dm}^{-3}}=117.8
\end{aligned}
$$

## PROBLEM 7

The density of a sulphuric acid solution in a charged lead accumulator should be equal to $\rho=1.28 \mathrm{~g} \mathrm{~cm}^{-3}$ which corresponds to the solution containing $36.87 \%$ of $\mathrm{H}_{2} \mathrm{SO}_{4}$ by mass. In a discharged lead accumulator it should not decrease under the value of $\rho=1.10 \mathrm{~g} \mathrm{~cm}^{-3}$ which corresponds to the $14.35 \%$ solution of sulphuric acid.
(Faraday's constant $F$ is equal to 26.8 $\mathrm{Ah} \mathrm{mol}^{-1}$.)
Problems:
7.1 Write the equation for a total electrochemical reaction that takes place in the lead accumulator when it is charged and discharged.
7.2 Calculate the masses of $\mathrm{H}_{2} \mathrm{O}$ and $\mathrm{H}_{2} \mathrm{SO}_{4}$ being consumed or formed according to the equation in No 1.
7.3 Calculate the mass of $\mathrm{H}_{2} \mathrm{SO}_{4}$ that is required to be added to a led accumulator with a capacity of 120 Ah if the content of $\mathrm{H}_{2} \mathrm{SO}_{4}$ is to be in the range as given in the task.
7.4 Calculate the difference in volumes of the sulphuric acid solutions in a charged and a discharged lead accumulator with a capacity of 120 Ah.

## SOLUTION

$7.1 \mathrm{PbO}_{2}+\mathrm{Pb}+2 \mathrm{H}_{2} \mathrm{SO}_{4} \underset{\text { charging }}{\stackrel{\text { discharging }}{\rightleftarrows}} 2 \mathrm{PbSO}_{4}+2 \mathrm{H}_{2} \mathrm{O}$
7.2
$n\left(\mathrm{H}_{2} \mathrm{SO}_{4}\right)=2 \mathrm{~mol} \quad n\left(\mathrm{H}_{2} \mathrm{O}\right)=2 \mathrm{~mol}$
$m\left(\mathrm{H}_{2} \mathrm{SO}_{4}\right)=196 \mathrm{~g} \quad m\left(\mathrm{H}_{2} \mathrm{O}\right)=36 \mathrm{~g}$
Discharging: $\quad \Delta m\left(\mathrm{H}_{2} \mathrm{SO}_{4}\right)=-196 \mathrm{~g}$

$$
\Delta m\left(\mathrm{H}_{2} \mathrm{O}\right)=+36 \mathrm{~g}
$$

Charging: $\quad \Delta m\left(\mathrm{H}_{2} \mathrm{SO}_{4}\right)=+196 \mathrm{~g}$
$\Delta m\left(\mathrm{H}_{2} \mathrm{O}\right)=-36 \mathrm{~g}$

### 7.3 The mass of $\mathrm{H}_{2} \mathrm{SO}_{4}$ required:

26.8 Ah corresponds to $98 \mathrm{~g} \mathrm{H}_{2} \mathrm{SO}_{4}$

120 Ah corresponds to $438.8 \mathrm{~g} \mathrm{H}_{2} \mathrm{SO}_{4}$

Analogously:
26.8 Ah corresponds to $18 \mathrm{~g} \mathrm{H}_{2} \mathrm{O}$

120 Ah corresponds to $80.6 \mathrm{~g} \mathrm{H}_{2} \mathrm{O}$
Discharged lead accumulator:
mass of $\mathrm{H}_{2} \mathrm{SO}_{4}$ solution - $m$
mass of $\mathrm{H}_{2} \mathrm{SO}_{4} \quad-\quad m_{1}$
mass fraction of $\mathrm{H}_{2} \mathrm{SO}_{4} \quad-\quad w_{1}=0.1435$
density of $\mathrm{H}_{2} \mathrm{SO}_{4}$ solution $\quad-\quad \rho_{1}=1.10 \mathrm{~g} \mathrm{~cm}^{-3}$

Charged lead accumulator:
mass of $\mathrm{H}_{2} \mathrm{SO}_{4}$ formed $\quad-\quad m_{2}=438.8 \mathrm{~g}$
mass of $\mathrm{H}_{2} \mathrm{O}$ consumed $\quad-\quad m_{3}=80.6 \mathrm{~g}$
mass fraction of $\mathrm{H}_{2} \mathrm{SO}_{4} \quad-\quad w_{2}=0.3687$
density of the $\mathrm{H}_{2} \mathrm{SO}_{4}$ solution $\quad-\quad \rho_{2}=1.28 \mathrm{~g} \mathrm{~cm}^{-3}$
Because:

$$
\begin{equation*}
w_{1}=\frac{m_{1}}{m} \tag{a}
\end{equation*}
$$

$$
\begin{equation*}
w_{2}=\frac{m_{1}+m_{2}}{m+m_{2}-m_{3}} \tag{b}
\end{equation*}
$$

We get a system of equations (a) and (b) which are solved for $m_{1}$ and $m$ :

$$
\begin{aligned}
& m_{1}=195.45 \mathrm{~g} \\
& m=1362 \mathrm{~g}
\end{aligned}
$$

7.4 Volume of the electrolyte $\mathrm{V}_{1}$ in a discharged lead accumulator:

$$
V_{1}=\frac{m}{\rho_{1}}=\frac{1362 \mathrm{~g}}{1.10 \mathrm{~g} \mathrm{~cm}^{-3}}=1238.2 \mathrm{~cm}^{3}
$$

Volume of the electrolyte $\mathrm{V}_{2}$ in a charged lead accumulator:

$$
V_{2}=\frac{m+m_{2}-m_{3}}{\rho_{2}}=\frac{1720.2 \mathrm{~g}}{1.28 \mathrm{~g} \mathrm{~cm}^{-3}}=1343.9 \mathrm{~cm}^{3}
$$

Difference in the volumes:
$\Delta V=V_{2}-V_{1}=1343.9-1238.2=105.7 \mathrm{~cm}^{3}$

## PROBLEM 5

Two copper(I) salts of the organic acids HA and HB, slightly soluble in water, form a saturated solution in buffer of a given pH .

## Problems:

5.1 What will be the concentration of $\mathrm{Cu}^{+}$cations in the solution if the solubility products of the two salts are $K_{\mathrm{s}}(\mathrm{CuA})$ and $K_{\mathrm{s}}(\mathrm{CuB})$ and the ionisation constants of the acids are $K_{\mathrm{a}}(\mathrm{HA})$ and $K_{\mathrm{a}}(\mathrm{HB})$ ?

## SOLUTION

5.1 Equations for the total amounts of substances of the particles $\mathrm{A}, \mathrm{B}$, and Cu are as follows:

$$
\begin{aligned}
& a=n\left(\mathrm{~A}^{-}\right)+n(\mathrm{HA})+n(\mathrm{CuA}) \\
& b=n\left(\mathrm{~B}^{-}\right)+n(\mathrm{HB})+n(\mathrm{CuB}) \\
& m=n\left(\mathrm{Cu}^{+}\right)+n(\mathrm{CuA})+n(\mathrm{CuB})
\end{aligned}
$$

The amounts of precipitates are eliminated from the equations:
$a+b-m=n\left(\mathrm{~A}^{-}\right)+n(\mathrm{HA})+n\left(\mathrm{~B}^{-}\right)+n(\mathrm{HB})-n\left(\mathrm{Cu}^{+}\right)=0$
because, when forming a system of both solid salts, the total number of particles $A$ and $B(a+b)$ must be equal to the total number of cations $\mathrm{Cu}^{+}$, i. e. to the value of $m$. When the amounts of substances are divided by the volume of the solution, we get concentrations, and thus:
$\left[\mathrm{A}^{-}\right]+[\mathrm{HA}]+\left[\mathrm{B}^{-}\right]+[\mathrm{HB}]=\left[\mathrm{Cu}^{+}\right]$
$K_{\mathrm{s}}(\mathrm{CuA})=\left[\mathrm{Cu}^{+}\right]\left[\mathrm{A}^{-}\right] \Rightarrow\left[\mathrm{A}^{-}\right]=\frac{K_{s}(\mathrm{CuA})}{\left[\mathrm{Cu}^{+}\right]}$
$K_{\mathrm{s}}(\mathrm{CuB})=\left[\mathrm{Cu}^{+}\right]\left[\mathrm{B}^{-}\right] \Rightarrow\left[\mathrm{B}^{-}\right]=\frac{K_{\mathrm{s}}(\mathrm{CuB})}{\left[\mathrm{Cu}^{+}\right]}$
$K_{a}(\mathrm{HA})=\frac{\left[\mathrm{H}^{+}\right]\left[\mathrm{A}^{-}\right]}{[\mathrm{HA}]} \Rightarrow[\mathrm{HA}]=\frac{\left[\mathrm{H}^{+}\right]\left[\mathrm{A}^{-}\right]}{K_{a}(\mathrm{HA})}$

$$
\begin{equation*}
K_{a}(\mathrm{HB})=\frac{\left[\mathrm{H}^{+}\right]\left[\mathrm{B}^{-}\right]}{[\mathrm{HB}]} \Rightarrow[\mathrm{HB}]=\frac{\left[\mathrm{H}^{+}\right]\left[\mathrm{B}^{-}\right]}{K_{a}(\mathrm{HB})} \tag{5}
\end{equation*}
$$

By substituting (4) and (5) into (1):

$$
\begin{equation*}
\left[\mathrm{Cu}^{+}\right]=\left[\mathrm{A}^{-}\right]\left(1+\frac{\left[\mathrm{H}^{+}\right]}{K_{\mathrm{a}}(\mathrm{HA})}\right)+\left[\mathrm{B}^{-}\right]\left(1+\frac{\left[\mathrm{H}^{+}\right]}{K_{\mathrm{a}}(\mathrm{HB})}\right) \tag{6}
\end{equation*}
$$

By substituting (2) and (3) into (6):

$$
\begin{align*}
& {\left[\mathrm{Cu}^{+}\right]=\frac{K_{\mathrm{s}}(\mathrm{CuA})}{\left[\mathrm{Cu} u^{+}\right]}\left(1+\frac{\left[\mathrm{H}^{+}\right]}{K_{\mathrm{a}}(\mathrm{HA})}\right)+\frac{K_{\mathrm{s}}(\mathrm{CuB})}{[\mathrm{Cu}]}\left(1+\frac{\left[\mathrm{H}^{+}\right]}{K_{\mathrm{a}}(\mathrm{HB})}\right)}  \tag{7}\\
& {\left[\mathrm{Cu}^{+}\right]=\sqrt{K_{\mathrm{s}}(\mathrm{CuA})\left(1+\frac{\left[\mathrm{H}^{+}\right]}{K_{\mathrm{a}}(\mathrm{HA})}\right)+K_{\mathrm{s}}(\mathrm{CuB})\left(1+\frac{\left[\mathrm{H}^{+}\right]}{K_{\mathrm{a}}(\mathrm{HB})}\right)}}
\end{align*}
$$

## PROBLEM 6

Amino acids can be determined by measuring the volume of nitrogen released in their reaction with nitrous acid (Van Slyke's method), for example:

$$
\mathrm{CH}_{3} \mathrm{CH}\left(\mathrm{NH}_{2}\right) \mathrm{COOH}+\mathrm{HNO}_{2} \rightarrow \mathrm{CH}_{3} \mathrm{CH}(\mathrm{OH}) \mathrm{COOH}+\mathrm{N}_{2}+\mathrm{H}_{2} \mathrm{O}
$$

Another method consists of the reaction of amino acids with a volumetric solution of perchloric acid, for example:

$$
\mathrm{CH}_{3} \mathrm{CH}\left(\mathrm{NH}_{2}\right) \mathrm{COOH}+\mathrm{HClO}_{4} \rightarrow \mathrm{CH}_{3} \mathrm{CH}\left(\mathrm{~N}^{+} \mathrm{H}_{3}\right) \mathrm{COOH}+\mathrm{ClO}_{4}^{-}
$$

The excess of the perchloric acid is determined then by titration with a volumetric solution of sodium acetate (carried out in a non-aqueous solution).
$50.0 \mathrm{~cm}^{3}$ of a 0.100 -normal solution of perchloric acid were added to a sample of glycine in glacial acetic acid. The excess of the perchloric acid was determined after the reaction by titration with 0.150 -normal volumetric solution of sodium acetate. The consumption was $16.0 \mathrm{~cm}^{3}$.

## Problem:

6.1 What would be the volume of the nitrogen released at a pressure of 102658 Pa and a temperature of $20^{\circ} \mathrm{C}$ when assumed that the same qua ntity of sample were analysed by the Van Slyke's method?

## SOLUTION

$6.1 n\left(\mathrm{HClO}_{4}\right)=V c=0.0500 \mathrm{dm}^{3} \times 0.100 \mathrm{~mol} \mathrm{dm}^{-3}=0.00500 \mathrm{~mol}$
$n(\mathrm{NaAc})=0.0160 \mathrm{dm}^{3} \times 0.150 \mathrm{~mol} \mathrm{dm}^{-3}=0.00240 \mathrm{~mol}$
Consumed in the reaction:
$n\left(\mathrm{HClO}_{4}\right)=(0.00500-0.00240) \mathrm{mol}=0.00260 \mathrm{~mol}$
$V\left(\mathrm{HClO}_{4}\right)=0.0260 \mathrm{dm}^{3}$
Since:
$n\left(\mathrm{HClO}_{4}\right)=n($ glycine $)=n\left(\mathrm{~N}_{2}\right)=0.0260 \mathrm{~mol}$
then:
$V\left(\mathrm{~N}_{2}\right)=\frac{n R T}{p}=\frac{0.0260 \mathrm{~mol} \times 8.314 \mathrm{Jmol}^{-1} \mathrm{~K}^{-1} \times 293.1 \mathrm{~K}}{102.658 \mathrm{kPa}}=0.617 \mathrm{dm}^{3}$

## THE TENTH <br> INTERNATIONAL CHEMISTRY OLYMPIAD 3-13 JULY 1978, TORUN, POLAND

## THEORETICAL PROBLEMS

## PROBLEM 1

a) A chromium ore which does not contain water, consists of: $\mathrm{Fe}\left(\mathrm{CrO}_{2}\right)_{2}, \mathrm{Mg}\left(\mathrm{CrO}_{2}\right)_{2}$, $\mathrm{MgCO}_{3}$, and $\mathrm{CaSiO}_{3}$.
b) It was found by analysis the ore contains $45.6 \%$ of $\mathrm{Cr}_{2} \mathrm{O}_{3}, 7.98 \%$ of $\mathrm{Fe}_{2} \mathrm{O}_{3}$, and 16.12 \% of MgO .
c) When the ore was treated with a concentrated hydrochloric acid, chromium compounds being present in the ore did not react with the acid.
d) When the reaction was finished, the ore was thoroughly washed with water (till the reaction with $\mathrm{Cl}^{-}$was negative) and the solid residue was dried to a constant mass.

Problems:
1.1 Write stoichiometric and ionic equations for the reactions taking place when the ore is treated with the hydrochloric acid as given in c).
1.2 Calculate:

- the content of the compounds (in mass \%) present in the ore,
- amounts of substances of the compounds present in the ore.
1.3 Calculate the content of $\mathrm{Cr}_{2} \mathrm{O}_{3}$ (in mass \%) in the dried residue obtained according to d).
1.4 A glass tube was filled with a sufficient amount of granulated CaO , the total mass of the filled tube having been 412.02 g . A gas formed by the reaction as given in c ), was dried and then transmitted through the glass tube. Calculate the mass of the glass tube with its filling after the reaction was finished.

Relative atomic masses: $A_{r}(\mathrm{Cr})=52.01 ; \quad A_{\mathrm{r}}(\mathrm{Fe})=55.85 ; \quad A_{\mathrm{r}}(\mathrm{Mg})=24.32 ; \quad A_{r}(\mathrm{Ca})=40.08 ;$

$$
A_{r}(\mathrm{Si})=28.09 ; \quad A_{r}(\mathrm{C})=12.01 ; \quad A_{r}(\mathrm{O})=16.00 .
$$

## SOLUTION

1.1 $\mathrm{MgCO}_{3}+2 \mathrm{HCl} \rightarrow \mathrm{MgCl}_{2}+\mathrm{CO}_{2}+\mathrm{H}_{2} \mathrm{O}$

```
\(\mathrm{MgCO}_{3}+2 \mathrm{H}^{+} \rightarrow \mathrm{Mg}^{2+}+\mathrm{CO}_{2}+\mathrm{H}_{2} \mathrm{O}\)
\(\mathrm{CaSiO}_{3}+2 \mathrm{HCl} \rightarrow \mathrm{CaCl}_{2}+\mathrm{SiO}_{2}+\mathrm{H}_{2} \mathrm{O}\)
\(\mathrm{CaSiO}_{3}+2 \mathrm{H}^{+} \rightarrow \mathrm{Ca}^{2+}+\mathrm{SiO}_{2}+\mathrm{H}_{2} \mathrm{O}\)
```

1.2 The total amount of iron is in the form of $\mathrm{Fe}\left(\mathrm{CrO}_{2}\right)_{2}$ :

Since:

$$
\mathrm{Fe}_{2} \mathrm{O}_{3} \triangleq 2 \mathrm{Fe}\left(\mathrm{CrO}_{2}\right)_{2}
$$

$M_{r}\left(\mathrm{Fe}_{2} \mathrm{O}_{3}\right)=159.70$
$M_{r}\left(\mathrm{Fe}\left(\mathrm{CrO}_{2}\right)_{2}\right)=223.87 \quad \% \mathrm{Fe}_{2} \mathrm{O}_{3}=7.98$
$\% \mathrm{Fe}\left(\mathrm{CrO}_{2}\right)_{2}=\frac{2 \times 223.87}{159.70} \times 7.98=22.37$
The difference between the total amount of $\mathrm{Cr}_{2} \mathrm{O}_{3}$ and that being contained in $\mathrm{Fe}\left(\mathrm{CrO}_{2}\right)_{2}$ corresponds to the amount of $\mathrm{Cr}_{2} \mathrm{O}_{3}$, having been in the form of $\mathrm{Mg}\left(\mathrm{CrO}_{2}\right)_{2}$.
$\% \mathrm{Cr}_{2} \mathrm{O}_{3}$ in $\mathrm{Fe}\left(\mathrm{CrO}_{2}\right)_{2}$ :

$\% \mathrm{Cr}_{2} \mathrm{O}_{3}=\frac{152.02}{223.87} \times 22.37=15.19$
$\% \mathrm{Cr}_{2} \mathrm{O}_{3}$ in $\mathrm{Mg}\left(\mathrm{CrO}_{2}\right)_{2}: 45.5-15.19=30.41$
Content of $\mathrm{Mg}\left(\mathrm{CrO}_{2}\right)_{2}$ :

$$
\begin{array}{ll} 
& \mathrm{Cr}_{2} \mathrm{O}_{3} \\
M_{\mathrm{r}}: & \mathrm{Mg}\left(\mathrm{Mg}_{2} .02\right.
\end{array}
$$

$\% \mathbf{M g}\left(\mathrm{CrO}_{2}\right)_{2}=\frac{192.34}{152.02} \times 30.41=38.47$
The difference between the total amount of MgO in the ore and that corresponding to $\mathrm{Mg}\left(\mathrm{CrO}_{2}\right)_{2}$, is contained in $\mathrm{MgCO}_{3} . \% \mathrm{MgO}$ and $\% \mathrm{MgCO}_{3}$ can be calculated analogously as it is given above.

$$
\begin{aligned}
& \mathrm{Mg}\left(\mathrm{CrO}_{2}\right)_{2} \widehat{=} \mathrm{MgO} \\
& M_{r}: \quad 192.34 \quad 40.32 \\
& \% \mathbf{M g O}=\frac{40.32}{192.34} \times 38.47=8.06 \\
& \mathrm{MgO} \xlongequal{ } \mathrm{MgCO}_{3} \\
& M_{r}: \quad 40.32 \quad 84.32 \\
& \% \mathrm{MgCO}_{3}=\frac{84.32}{40.32} \times 8.06=16.86
\end{aligned}
$$

Content of $\mathrm{CaSiO}_{3}$ is obtained as complementary value to $100 \%$.
$\% \mathrm{CaSiO}_{3}=100-(22.37+38.47+16.86)=22.30$
One kilogram of the ore contains:
223.7 g of $\mathrm{Fe}\left(\mathrm{CrO}_{2}\right)_{2} \xlongequal{ }$ = 1 mol
384.7 g of $\mathrm{Mg}\left(\mathrm{CrO}_{2}\right)_{2} \xlongequal{ }$ 2 mol
168.6 g of $\mathrm{MgCO}_{3} \xlongequal{ }$ ( mol
223.0 g of $\mathrm{CaSiO}_{3} \xlongequal{ }$ ( 2 mol
1.3 In order to simplify the problem we can assume that the hydrochloric acid reacts with 1 kg of the ore, i. e. with 168.6 g of $\mathrm{MgCO}_{3}$ and with that CaO which is contained in $223.0 \mathrm{~g} \mathrm{CaSiO}_{3}$, i. e. with 107.65 of CaO .
Thus, 276.25 g of the ore $(168.6 \mathrm{~g}+107.65 \mathrm{~g})$ reacted while 723.75 g remain unreacted.

One kilogram of the ore contains 456 g of $\mathrm{Cr}_{2} \mathrm{O}_{3}(45.6 \%)$ and the same amount remains in the unreacted part that represents:
$\% \mathrm{Cr}_{2} \mathrm{O}_{3}=\frac{456}{723.75} \times 100=63.0$
1.4 The mass of the filling in the tube is increased by the mass of $\mathrm{CO}_{2}$ formed by decomposition of $\mathrm{MgCO}_{3}$ with hydrochloric acid. From 168.6 g of $\mathrm{MgCO}_{3} 87.98 \mathrm{~g}$ of $\mathrm{CO}_{2}$ are formed and thus, the mass of the tube after reaction is 500 g .

## PROBLEM 2

A sample of water under investigation had $10^{\circ}$ of temporary hardness and $10^{\circ}$ of permanent hardness. Hardness of the water was caused by cations $\mathrm{Fe}^{2+}$ and $\mathrm{Ca}^{2+}$ only.

A volume of $10.00 \mathrm{dm}^{3}$ of the water was at disposal. From this volume $100.00 \mathrm{~cm}^{3}$ were taken for further procedure. The water was oxidised with a $\mathrm{H}_{2} \mathrm{O}_{2}$ solution and then precipitated with an aqueous ammonia solution. A brown precipitate was dried and after an appropriate heating 0.01432 g of an anhydrous product was obtained.

## Problems:

2.1 Calculate the molar ratio of $\mathrm{Fe}^{2+}: \mathrm{Ca}^{2+}$ in the water under investigation.
2.2 In another experiment, $10.00 \mathrm{dm}^{3}$ of the water was used again. The temporary hardness caused by cations $\mathrm{Ca}^{2+}$ was removed first and the permanent hardness caused by cations $\mathrm{Fe}^{2+}$ was removed by addition of $\mathrm{Na}_{3} \mathrm{PO}_{4}$. Calculate the mass of the precipitate (in its anhydrous form) on the assumption that only one half of cations $\mathrm{Fe}^{2+}$ was oxidised to $\mathrm{Fe}^{3+}$ in $10.00 \mathrm{dm}^{3}$ of the water analysed. Calculation should be made with an accuracy of one hundredth. Give the molar ratio in integers.
$1^{\circ}$ of hardness $=10 \mathrm{mg} \mathrm{CaO}$ in $1 \mathrm{dm}^{3}$ of water.
Relative atomic masses:
$\begin{array}{lll}A_{r}(\mathrm{Ca})=40.08 ; & A_{r}(\mathrm{Fe})=55.85 ; & A_{r}(\mathrm{C})=12.01 ; \\ A_{r}(\mathrm{H})=1.01 ; & A_{r}(\mathrm{P})=31.00 ; & A_{r}(\mathrm{O})=16.00 .\end{array}$

## SOLUTION

2.1 Anhydrous product: $\mathrm{Fe}_{2} \mathrm{O}_{3}$ $m\left(\mathrm{Fe}_{2} \mathrm{O}_{3}\right)=0.01432 \mathrm{~g}$ from $100 \mathrm{~cm}^{3}$ of water, i. e. 1.432 g from $10 \mathrm{dm}^{3}$ $1 \mathrm{~mol} \mathrm{Fe}_{2} \mathrm{O}_{3} \Leftrightarrow 2 \mathrm{~mol} \mathrm{FeO}$
$n\left(\mathrm{Fe}_{2} \mathrm{O}_{3}\right)=\frac{1.432 \mathrm{~g}}{159.7 \mathrm{~g} \mathrm{~mol}^{-1}} \approx 0.009 \mathrm{~mol}$
$m(\mathrm{FeO})=n M=2 \times 0.009 \mathrm{~mol} \times 71.85 \mathrm{~g} \mathrm{~mol}^{-1} \approx 1.293 \mathrm{~g}$
$1^{\circ}$ of hardness $=10 \mathrm{mg} \mathrm{CaO} / \mathrm{dm}^{3}$ of water
$1^{\circ}$ of hardness $=\frac{M(\mathrm{FeO})}{M(\mathrm{CaO})} \times 10 \mathrm{mg}=12.81 \mathrm{mg} \mathrm{FeO} / \mathrm{dm3}$ of water
$\frac{1.293 \mathrm{~g} \mathrm{FeO}}{0.1281 \mathrm{~g} \mathrm{FeO}} \approx 10^{\circ}$ of hardness
Since the water has totally $20^{\circ}$ of hardness, and $10^{\circ}$ of hardness fall on FeO , the other $10^{\circ}$ of hardness are attributed to CaO which corresp onds to 1 g of CaO in $10 \mathrm{dm}^{3}$ of the water.
Molar ratio:
$n(\mathrm{FeO}): n(\mathrm{CaO})=\frac{m(\mathrm{FeO})}{M(\mathrm{FeO})}: \frac{m(\mathrm{CaO})}{M(\mathrm{CaO})}=\frac{1.289 \mathrm{~g}}{71.85 \mathrm{~g} \mathrm{~mol}^{-1}}: \frac{1 \mathrm{~g}}{56.08 \mathrm{~g} \mathrm{~mol}^{-1}}=1: 1$
2.2 A volume of $10.00 \mathrm{dm}^{3}$ of the water contains so much iron that corresponds to 1.293 g of $\mathrm{FeO} .50 \%$ of iron ( 0.6445 g of FeO ) were oxidised to $\mathrm{Fe}(\mathrm{III})$, and therefore $\mathrm{Fe}_{3}\left(\mathrm{PO}_{4}\right)_{2}$ as well as $\mathrm{FePO}_{4}$ are formed at the same time.
$3 \mathrm{~mol} \mathrm{FeO} \quad \ldots . . .1 \mathrm{~mol} \mathrm{Fe}_{3}\left(\mathrm{PO}_{4}\right)_{2}$
$215.55 \mathrm{~g} \quad . . . . . \quad 357.55 \mathrm{~g}$
$0.6445 \mathrm{~g} \quad . . .$.
$1 \mathrm{~mol} \mathrm{FeO} . . . . . \quad 1 \mathrm{~mol} \mathrm{FePO}_{4}$
$71.85 \mathrm{~g} \quad . . . . . \quad 150.85 \mathrm{~g}$
$0.6445 \mathrm{~g} \quad \ldots . . . \quad 1.3542 \mathrm{~g} \mathrm{FePO}_{4}$

Mass of the precipitate: $\quad 1.0699 \mathrm{~g}+1.3542 \mathrm{~g}=\underline{2.4241 \mathrm{~g}}$

## PROBLEM 2

An alloy comprises the following metals: cadmium, tin, bismuth, and lead. A sample of this alloy weighing 1.2860 g , was treated with a solution of concentrated nitric acid. The individual compound of metal A obtained as a precipitate, was separated, thoroughly washed, dried and calcinated. The mass of the precipitate after the calcination to constant mass, was 0.3265 g .

An aqueous ammonia solution was added in excess to the solution obtained after separation of the precipitate. A compound of metal B remained in the solution while all the other metals precipitated in the form of sparingly soluble compounds. The solution was first quantitatively separated from the precipitate, and then hydrogen sulphide was passed through the separated solution to saturation. The resulting precipitate containing metal $\mathbf{B}$ was separated, washed and dried. The mass of the precipitate was 0.6613 g .

The precipitate containing the compounds of metals $\mathbf{C}$ and $\mathbf{D}$ was treated with an excess of a NaOH solution. The solution and the precipitate were then quantitatively separated. A solution of $\mathrm{HNO}_{3}$ was added to the alkaline solution to reach $\mathrm{pH} 5-6$, and an excess of $\mathrm{K}_{2} \mathrm{CrO}_{4}$ solution was added to the resulting transparent solution. The yellow precipitate was separated, washed and quantitatively transferred to a beaker. Finally a dilute $\mathrm{H}_{2} \mathrm{SO}_{4}$ solution and crystalline KI were added. lodine produced as a result of the reaction was titrated with sodium thiosulphate solution in the presence of starch as an indicator. 18.46 $\mathrm{cm}^{3}$ of 0.1512 normal $\mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3}$ solution were required.

The last metal contained in the precipitate as a sparingly soluble compound was transformed to an even less soluble phosphate and its mass was found to be 0.4675 g .
2.1 Write all equations of the chemical reactions on which the quantitative analysis of the alloy sample is based. Name metals A, B, C, and D. Calculate the mass percentage of the metals in the alloy.

## SOLUTION

2.1 The action of nitric acid on the alloy:
$\mathrm{Sn}+4 \mathrm{HNO}_{3} \rightarrow \mathrm{H}_{2} \mathrm{SnO}_{3}+4 \mathrm{NO}_{2}+\mathrm{H}_{2} \mathrm{O}$
$\mathrm{Pb}+4 \mathrm{HNO}_{3} \rightarrow \mathrm{~Pb}\left(\mathrm{NO}_{3}\right)_{2}+2 \mathrm{NO}_{2}+2 \mathrm{H}_{2} \mathrm{O}$
$\mathrm{Bi}+6 \mathrm{HNO}_{3} \rightarrow \mathrm{Bi}\left(\mathrm{NO}_{3}\right)_{3}+3 \mathrm{NO}_{2}+3 \mathrm{H}_{2} \mathrm{O}$
$\mathrm{Cd}+4 \mathrm{HNO}_{3} \rightarrow \mathrm{Cd}\left(\mathrm{NO}_{3}\right)_{2}+2 \mathrm{NO}_{2}+2 \mathrm{H}_{2} \mathrm{O}$

Weight form of tin determination:
$\mathrm{H}_{2} \mathrm{SnO}_{3} \rightarrow \mathrm{SnO}_{2}+\mathrm{H}_{2} \mathrm{O}$
Calculation of tin content in the alloy:
$M(\mathrm{Sn})=118.7 \mathrm{~g} \mathrm{~mol}^{-1} ; \quad M\left(\mathrm{SnO}_{2}\right)=150.7 \mathrm{~g} \mathrm{~mol}^{-1}$
$\frac{m(\mathrm{Sn})}{m\left(\mathrm{SnO}_{2}\right)}=\frac{M(\mathrm{Sn})}{M\left(\mathrm{SnO}_{2}\right)} ; \quad m(\mathrm{Sn})=\frac{118.7 \mathrm{~g} \mathrm{~mol}^{-1} \times 0.3265 \mathrm{~g}}{150.7 \mathrm{~g} \mathrm{~mol}^{-1}}=0.2571 \mathrm{~g}$
Mass percentage of tin (metal $A$ ) in the alloy:

$$
w(\mathrm{Sn})=\frac{0.2571 \mathrm{~g}}{1.2860 \mathrm{~g}}=0.1999=19.99 \%
$$

The reactions taking place in the excess of aqueous ammonia solution:
$\mathrm{Pb}\left(\mathrm{NO}_{3}\right)_{2}+2 \mathrm{NH}_{4} \mathrm{OH} \rightarrow \mathrm{Pb}(\mathrm{OH})_{2} \downarrow+2 \mathrm{NH}_{4} \mathrm{NO}_{3}$
$\mathrm{Bi}\left(\mathrm{NO}_{3}\right)_{3}+3 \mathrm{NH}_{4} \mathrm{OH} \rightarrow \mathrm{Bi}(\mathrm{OH})_{3} \downarrow+3 \mathrm{NH}_{4} \mathrm{NO}_{3}$
$\mathrm{Cd}\left(\mathrm{NO}_{3}\right)_{2}+4 \mathrm{NH}_{4} \mathrm{OH} \rightarrow\left[\mathrm{Cd}\left(\mathrm{NH}_{3}\right)_{4}\right]\left(\mathrm{NO}_{3}\right)_{2}+4 \mathrm{H}_{2} \mathrm{O}$
solution
Saturating of the solution with hydrogen sulphide:
$\left[\mathrm{Cd}\left(\mathrm{NH}_{3}\right)_{4}\right]\left(\mathrm{NO}_{3}\right)_{2}+2 \mathrm{H}_{2} \mathrm{~S} \rightarrow \mathrm{CdS} \downarrow+2 \mathrm{NH}_{4} \mathrm{NO}_{3}+\left(\mathrm{NH}_{4}\right)_{2} \mathrm{~S}$
Calculation of the cadmium content in the alloy:

$$
\begin{aligned}
& M(\mathrm{Cd})=112.4 \mathrm{~g} \mathrm{~mol}^{-1} ; \quad M(\mathrm{CdS})=144.5 \mathrm{~g} \mathrm{~mol}^{-1} \\
& m(\mathrm{Cd})=\frac{112.4 \mathrm{~g} \mathrm{~mol}^{-1} \times 0.6613 \mathrm{~g}}{144.5 \mathrm{~g} \mathrm{~mol}^{-1}}=0.5143 \mathrm{~g}
\end{aligned}
$$

Mass percentage of cadmium (metal B) in the alloy:

$$
w(\mathrm{Cd})=\frac{0.5143 \mathrm{~g}}{1.2860 \mathrm{~g}}=0.3999=39.99 \%
$$

The reactions taking place in the excess of sodium hydroxide solution:
The action of excess sodium hydroxide on lead(II) and bismuth(III) hydroxides:
$\mathrm{Pb}(\mathrm{OH})_{2}+2 \mathrm{NaOH} \rightarrow \mathrm{Na}_{2}\left[\mathrm{~Pb}(\mathrm{OH})_{4}\right]$
solution
$\mathrm{Bi}(\mathrm{OH})_{3}+\mathrm{NaOH} \rightarrow$ no reaction

Acidification of the solution with nitric acid $(\mathrm{pH}=5-6)$ :
$\mathrm{Na}_{2}\left[\mathrm{~Pb}(\mathrm{OH})_{4}\right]+4 \mathrm{HNO}_{3} \rightarrow \mathrm{~Pb}\left(\mathrm{NO}_{3}\right)_{2}+2 \mathrm{NaNO}_{3}+4 \mathrm{H}_{2} \mathrm{O}$

The reaction with $\mathrm{K}_{2} \mathrm{CrO}_{4}$ :

$$
\mathrm{Pb}\left(\mathrm{NO}_{3}\right)_{2}+\mathrm{K}_{2} \mathrm{CrO}_{4} \rightarrow \mathrm{PbCrO}_{4} \downarrow+2 \mathrm{KNO}_{3}
$$

The reactions on which the quantitative determination of lead in $\mathrm{PbCrO}_{4}$ precipitate is based:
$2 \mathrm{PbCrO}_{4}+6 \mathrm{KI}+8 \mathrm{H}_{2} \mathrm{SO}_{4} \rightarrow 3 \mathrm{I}_{2}+2 \mathrm{PbSO}_{4}+3 \mathrm{~K}_{2} \mathrm{SO}_{4}+\mathrm{Cr}_{2}\left(\mathrm{SO}_{4}\right)_{3}+8 \mathrm{H}_{2} \mathrm{O}$ $\mathrm{I}_{2}+2 \mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3} \rightarrow 2 \mathrm{NaI}+\mathrm{Na}_{2} \mathrm{~S}_{4} \mathrm{O}_{6}$
Percentage of lead (metal C) in the alloy:

$$
w(\mathrm{~Pb})=\frac{c\left(\mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3}\right) \times V\left(\mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3}\right) \times M(\mathrm{~Pb})}{m(\mathrm{alloy}) \times 3}
$$

(One $\mathrm{Pb}^{2+}$ ion corresponds to one $\mathrm{CrO}_{4}^{2-}$ ion which accepts 3 electrons in the redox reaction considered.)

$$
w(\mathrm{~Pb})=\frac{0.1512 \mathrm{~mol} \mathrm{dm}^{-3} \times 0.01846 \mathrm{dm}^{3} \times 207.2 \mathrm{~g} \mathrm{~mol}^{-1}}{1.286 \mathrm{~g} \times 3}=0.1499=14.99 \%
$$

In order to convert bismuth(III) hydroxide to phosphate it is necessary:
a) to dissolve the bismuth(III) hydroxide in an acid:

$$
\mathrm{Bi}(\mathrm{OH})_{3}+3 \mathrm{HNO}_{3} \rightarrow \mathrm{Bi}\left(\mathrm{NO}_{3}\right)_{3}+3 \mathrm{H}_{2} \mathrm{O}
$$

b) to precipitate $\mathrm{Bi}^{3+}$ ions with phosphate ions:

$$
\mathrm{Bi}\left(\mathrm{NO}_{3}\right)_{3}+\mathrm{K}_{3} \mathrm{PO}_{4} \rightarrow \mathrm{BiPO}_{4} \downarrow+3 \mathrm{KNO}_{3}
$$

Calculation of the bismuth content in the alloy:

$$
\begin{aligned}
& M(\mathrm{Bi})=209 \mathrm{~g} \mathrm{~mol}^{-1} ; \quad M\left(\mathrm{BiPO}_{4}\right)=304 \mathrm{~g} \mathrm{~mol}^{-1} \\
& m(\mathrm{Bi})=\frac{209 \mathrm{~g} \mathrm{~mol}^{-1} \times 0.4676 \mathrm{~g}}{304 \mathrm{~g} \mathrm{~mol}^{-1}}=0.3215 \mathrm{~g}
\end{aligned}
$$

Percentage of bismuth (metal D) in the alloy:
$w(\mathrm{Bi})=\frac{0.3215 \mathrm{~g}}{1.2860 \mathrm{~g}}=0.2500=25.00 \%$
Composition of the alloy: $\% \mathrm{Cd}=40, \quad \% \mathrm{Sn}=20, \quad \% \mathrm{~Pb}=15, \quad \% \mathrm{Bi}=25$

## PROBLEM 3

(Chemistry of ions, stoichiometry, redox reactions)

A white crystalline solid compound $\mathbf{A}$ exhibits the following reactions:

1) The flame of a Bunsen burner is intensively yellow coloured.
2) An aqueous solution of $\mathbf{A}$ is neutral. Dropwise addition of sulphurous acid (an $\mathrm{SO}_{2}$ solution) leads to a deep brown solution that is discoloured in the presence of excess of sulphurous acid.
3) If an $\mathrm{AgNO}_{3}$ solution is added to the discoloured solution obtained by 2) and acidified with $\mathrm{HNO}_{3}$, a yellow precipitate is obtained that is insoluble on addition of $\mathrm{NH}_{3}$, but can be readily dissolved by adding $\mathrm{CN}^{-}$or $\mathrm{S}_{2} \mathrm{O}_{3}^{2-}$.
4) If an aqueous solution of $\mathbf{A}$ is treated with KI and dilute $\mathrm{H}_{2} \mathrm{SO}_{4}$ a deep brown solution is formed that can be discoloured by addition of sulphurous acid or a $\mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3}$ solution.
5) An amount of 0.1000 g of $\mathbf{A}$ is dissolved in water, then 0.5 g KI and a few $\mathrm{cm}^{3}$ of dilute $\mathrm{H}_{2} \mathrm{SO}_{4}$ are added. The deep brown solution formed is titrated with $0.1000 \mathrm{M} \mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3}$ solution until the solution is completely discoloured. The consumption is $37.40 \mathrm{~cm}^{3}$.
Problems:
3.1 What elements are contained in the compound $\mathbf{A}$ ?
3.2 What compounds can be considered as present on the basis of reactions 1) to 4)? Calculate their molar masses.
3.3 Formulate the reactions corresponding to 2) to 4) for the compounds considered and write the corresponding equations in the ionic form.
3.4 Decide on the basis of 5) which compound is present.

## SOLUTION

3.1 The solid must contain Na and I . The yellow colouration of the flame of the Bunsen burner indicates the presence of Na . A yellow silver salt that is dissolved only by strong complexing agents such as $\mathrm{CN}^{-}$or $\mathrm{S}_{2} \mathrm{O}_{3}^{2-}$, must be AgI .
3.2 Reactions 1) to 4) indicate an Na salt of an oxygen containing acid of iodine:

Both $\mathrm{SO}_{2}$ and $\mathrm{I}^{-}$are oxidised. While in the first case $\mathrm{I}^{-}$is formed with an intermediate of $\mathrm{I}_{2}$ (or $\mathrm{I}_{3}^{-}$, brown solution), in the second $\mathrm{I}_{2}$ (or $\mathrm{I}_{3}^{-}$) is formed.

As the solution of $\mathbf{A}$ is neutral, $\mathrm{NaIO}_{3}$ and $\mathrm{NaIO}_{4}$ come into consideration.
$M\left(\mathrm{NaIO}_{3}\right)=22.99+126.905+3 \times 16.000=197.895=197.90 \mathrm{~g} \mathrm{~mol}^{-1}$
$M\left(\mathrm{NaIO}_{4}\right)=22.99+126.905+4 \times 16.000=213.895=213.90 \mathrm{~g} \mathrm{~mol}^{-1}$
$3.32 \mathrm{IO}_{3}^{-}+4 \mathrm{H}_{2} \mathrm{O}+5 \mathrm{SO}_{2}=5 \mathrm{HSO}_{4}^{-}+3 \mathrm{H}^{+}+\mathrm{I}_{2}$
$\mathrm{I}_{2}+\mathrm{SO}_{2}+2 \mathrm{H}_{2} \mathrm{O}=\mathrm{HSO}_{4}^{-}+3 \mathrm{H}^{+}+2 \mathrm{I}^{-}$
$\mathrm{IO}_{4}^{-}+7 \mathrm{I}^{-}+8 \mathrm{H}^{+}=4 \mathrm{I}_{2}+4 \mathrm{H}_{2} \mathrm{O}$
$\mathrm{IO}_{3}^{-}+5 \mathrm{I}^{-}+6 \mathrm{H}^{+}=3 \mathrm{I}_{2}+3 \mathrm{H}_{2} \mathrm{O}$
$\mathrm{I}_{2}+2 \mathrm{~S}_{2} \mathrm{O}_{3}^{2-}=2 \mathrm{I}^{-}+\mathrm{S}_{4} \mathrm{O}_{6}^{2-}$
3.4 Experiment: 0.1000 g of the compound $\mathbf{A} \ldots . . .3 .740 \times 10^{-3}$ moles $\mathrm{S}_{2} \mathrm{O}_{3}^{2-}$ $1^{\text {st }}$ hypothesis: The compound is $\mathrm{NaIO}_{3}$. 1 mole $\mathrm{NaIO}_{3} \ldots 197.90 \mathrm{~g} \mathrm{NaIO}_{3} \ldots 66$ moles $\mathrm{S}_{2} \mathrm{O}_{3}^{2-}$
$0.1000 \mathrm{~g} \mathrm{NaIO}_{3} \ldots \frac{0.1000 \times 6}{197.90}=3.032 \times 10^{-3}$ moles $\mathrm{S}_{2} \mathrm{O}_{3}^{2-}$
The hypothesis is false.
$2^{\text {nd }}$ hypothesis: The compound is $\mathrm{NaIO}_{4}$.
mole $\mathrm{NaIO}_{4} \ldots 213.90 \mathrm{~g} \mathrm{NaIO}_{4} \ldots 8$ moles $\mathrm{S}_{2} \mathrm{O}_{3}^{2-}$
$0.1000 \mathrm{~g} \mathrm{NaIO}_{4} \ldots \frac{0.1000 \times 8}{213.90}=3.740 \times 10^{-3}$ moles $\mathrm{S}_{2} \mathrm{O}_{3}^{2-}$
The compound $\mathbf{A}$ is $\mathrm{NaIO}_{4}$.

## PROBLEM 2

Maleic acid $\left(\mathrm{H}_{2} A\right)$ is a weak dibasic acid. The correlation between the relative quantities of $\mathrm{H}_{2} A, \mathrm{HA}^{-}, A^{2-}$ :
$\alpha_{0}=\frac{c\left(\mathrm{H}_{2} \mathrm{~A}\right)}{c}$
$\alpha_{1}=\frac{c\left(\mathrm{HA}^{-}\right)}{c}$

$$
\alpha_{2}=\frac{c\left(\mathrm{~A}^{2-}\right)}{c}
$$

and pH values of the solution show that:
a) $\alpha_{0}=\alpha_{1} \quad$ for $\mathrm{pH}=1.92$
b) $\alpha_{1}=\alpha_{2} \quad$ for $\mathrm{pH}=6.22$

## Find:

2.1 The values of the dissociation constants of maleic acid for the first $\left(K_{1}\right)$ and the second $\left(K_{2}\right)$ degree of dissociation.
2.2 The values of $\alpha_{0}, \alpha_{1}$, and $\alpha_{2}$ for $\mathrm{pH}=1.92$ and $\mathrm{pH}=6.22$.
2.3 What is the value of pH when $\alpha_{1}$ attains a maximum value? Find the maximum value of $\alpha$.
2.4 Which of the acid-base indicators in the table are suitable for titration of a 0.1 M solution of maleic acid (as a monobasic and as a dibasic acid) with 0.1 M NaOH ?

Fill in the table 1 with the correct answers.
All the activity coefficients should be considered equal to 1 .

| Indicator | pH interval |
| :--- | :---: |
| Methyl green | $0.1-2.0$ |
| Tropeolin 00 | $1.4-3.2$ |
| $\beta$-Dinitrophenol | $2.4-4.0$ |
| Bromphenol blue | $3.0-4.6$ |
| Congo red | $3.0-5.2$ |
| Methyl red | $4.4-6.2$ |
| Bromphenol red | $5.0-6.8$ |
| Bromthymol blue | $6.0-7.6$ |
| Phenol red | $6.8-8.0$ |
| Cresol red | $7.2-8.8$ |

| Thymol blue | $8.0-9.6$ |
| :--- | :---: |
| Phenolphthalein | $8.2-10.0$ |
| Alizarine yellow | $10.1-12.1$ |
| Tropeolin 0 | $11.0-13.0$ |
| $1,3,5-$ Trinitrobenzene | $12.2-14.0$ |

Table 1

## SOLUTION

$2.1 \alpha_{0}=\alpha_{1}$
$\mathrm{K}_{1}=c_{\mathrm{H}^{+}}=10^{-\mathrm{pH}}=10^{-1.92}=1.20 \times 10^{-2}$
$\alpha_{1}=\alpha_{2}$
$\mathrm{K}_{2}=c_{\mathrm{H}^{+}}=10^{-\mathrm{pH}}=10^{-6.22}=6.02 \times 10^{-7}$
2.2 $\mathrm{F}=c_{\mathrm{H}^{+}}^{2}+\mathrm{K}_{1} c_{\mathrm{H}^{+}}+\mathrm{K}_{1} \mathrm{~K}_{2}$
$\mathrm{pH}=1.92 ; \quad c_{\mathrm{H}^{+}}=10^{-1.92}=1.20 \times 10^{-2} ; \quad \mathrm{F}=2.88 \times 10^{-4}$
$\alpha_{0}=\alpha_{1}=\frac{C_{\mathrm{H}^{+}}^{2}}{\mathrm{~F}}=\frac{\left(1 \cdot 20 \cdot 10^{-2}\right)^{2}}{2 \cdot 88 \cdot 10^{-4}}=0.500$
$\alpha_{2}=\frac{K_{1} K_{2}}{\mathrm{~F}}=\frac{1.20 .10^{-2} \times 6.02 \cdot 10^{-7}}{2.88 .10^{-4}}=2.51 \times 10^{-5}$
$\mathrm{pH}=6.22 ; \quad c_{\mathrm{H}^{+}}=10^{-6.22}=6.02 \times 10^{-7} ; \quad \mathrm{F}=1.445 \times 10^{-8}$
$\alpha_{0}=\frac{C_{\mathrm{H}^{+}}^{2}}{\mathrm{~F}}=\frac{\left(6.02 \times 10^{-7}\right)^{2}}{1.445 \times 10^{-8}}=2.51 \times 10^{-5}$
$\alpha_{1}=\alpha_{2}=\frac{K_{1} K_{2}}{\mathrm{~F}}=\frac{1.20 \times 10^{-2} \times 6.02 \times 10^{-7}}{1.445 \times 10^{-8}}=0.500$
$2.3(\alpha)_{\mathrm{C}_{\mathrm{H}^{+}}^{\prime}}^{\prime}=\frac{\left[K_{1} F-K_{1} c_{H^{+}}\left(2 c_{H^{+}}+K_{1}\right]\right.}{F^{2}}=0$
$c_{H^{+}}^{2}=K_{1} K_{2}$
$c_{H^{+}}=\sqrt{\left(1.20 \times 10^{-2} \times 6.02 \times 10^{-7}\right.}=8.50 \times 10^{-5} \mathrm{~mol} \mathrm{dm}^{-3}$
$\mathrm{F}=1.034 \times 10^{-6} \quad \mathrm{pH}=4.07$
$\alpha_{1}=\frac{K_{1} c_{\mathrm{H}^{+}}}{\mathrm{F}}=\frac{1.20 \times 10^{-2} \times 8.50 \times 10^{-5}}{1.034 \times 10^{-6}}=0.986$
The pH and the maximum value of $\alpha_{1}$ can be estimated either by calculating $\alpha_{1}$ for a set of values of $c_{\mathrm{H}^{+}}$in the interval $1 \times 10^{-5}-1 \times 10^{-3} \mathrm{~mol} \mathrm{dm}^{-3}$ or from the condition that $\alpha_{1}$ can reach a maximum value only when $\alpha_{0}=\alpha_{2}$
2.4 The first equivalence point is found in the region of the $\alpha_{1}$ maximum at $\mathrm{pH}=4.07$ where $\quad c_{\mathrm{HA}^{-}}=c_{\mathrm{NaHA}}=\frac{0.1}{2}=0.05 \mathrm{~mol} \mathrm{dm}^{-3}$.

The second equivalence point is found in the alkaline region, where:

$$
\begin{aligned}
& c_{\mathrm{OH}^{-}}=c_{H A^{-}} \quad c_{\mathrm{A}^{2-}}=\frac{0.1}{3}-c_{\mathrm{OH}^{-}}=0.0333 \\
& c_{\mathrm{H}^{+}}^{2}=\frac{K_{2} c_{\mathrm{HA}}}{c_{\mathrm{A}^{2}}}=\frac{K_{2} c_{\mathrm{OH}}}{c_{\mathrm{A}^{2}}}=\frac{K_{2} K_{w}}{c_{\mathrm{H}^{+}} c_{\mathrm{A}^{2}}} \\
& c_{\mathrm{H}^{+}}=\sqrt{\frac{K_{2} K_{w}}{c_{\mathrm{A}^{2}}}}=\sqrt{\frac{6.02 \times 10^{-7} \times 1 \times 10^{-14}}{0.0333}}=4.25 \times 10^{-10} \mathrm{moldm}^{-3}
\end{aligned}
$$

$\mathrm{pH}=9.37$
Indicators:
Bromphenol blue, Congo red, thymol blue, phenolphthalein.

## PROBLEM 2

Quantitative analysis for carbon and hydrogen was originally carried out using a technique and apparatus (see figure) originally developed in 1831 by the famous chemist Justus Liebig. A carefully weighed sample of organic compound (C) is placed in a combustion tube (A) and vaporized by heating in a furnace (B). The vapours are swept by a stream of oxygen through a heated copper oxide packing (D) and through another furnace (E), which ensures the quantitative oxidation of carbon and hydrogen to carbon dioxide and water. The water vapour is absorbed in a weighed tube ( F ) containing magnesium perchlorate and the carbon dioxide in another weighed tube (G) containing asbestos impregnated with sodium hydroxide.

A pure liquid sample containing only carbon, hydrogen and oxygen is placed in a 0.57148 g platinum boat, which on reweighing weights 0.61227 g . The sample is ignited and the previously weighed absorption tubes are reweighed. The mass of the water absorption tube has increased from 6.47002 g to 6.50359 g , and the mass of the carbon dioxide tube has increased from 5.46311 g to 5.54466 g .
2.1 Calculate the mass composition of the compound.
2.2 Give the empirical formula of the compound.

To estimate the molar mass of the compound, 1.0045 g was gasified. The volume, measured at a temperature of 350 K and a pressure of 35.0 kPa , was $0.95 \mathrm{dm}^{3}$.
2.3 Give the molar mass and the molecular formula of the compound.
2.4 Draw possible structures corresponding to the molecular formula excluding cyclic structures, stereo isomers, peroxides and unsaturated compounds. There are about 15 possibilities. Give 10 of them.

When the compound is heated with a sodium hydroxide solution, two products are formed. Fractional distillation of the reaction mixture yields one of the substances. The other substance is purified by distillation after acidification and appears to be an acid.

### 2.5 What structures are possible for compound $C$ ?

0.1005 g of the acid are dissolved in water and titrated with a sodium hydroxide solution with a concentration of $0.1000 \mathrm{~mol} \mathrm{dm}^{-3}$. The indicator changes colour on addition of $16.75 \mathrm{~cm}^{3}$ of hydroxide solution.
2.6 What was the original substance $C$ ?

## SOLUTION

2.1 Mass percentage composition: 54.56 \% C; $9.21 \% ~ H ; \quad 36.23 \%$ O
2.2 Empirical formula: $\mathrm{C}_{2} \mathrm{H}_{4} \mathrm{O}$
2.3 Molar mass: $\quad 88 \mathrm{~g} \mathrm{~mol}^{-1}$

Molecular formula: $\quad \mathrm{C}_{4} \mathrm{H}_{8} \mathrm{O}_{2}$
2.4 Possible structures:

1. $\mathrm{CH}_{3}-\mathrm{CH}_{2}-\mathrm{CH}_{2}-\mathrm{COOH}$
2. $\mathrm{CH}_{3}-\mathrm{CH}\left(\mathrm{CH}_{3}\right)-\mathrm{COOH}$
3. $\mathrm{CH}_{3}-\mathrm{O}-\mathrm{CO}-\mathrm{CH}_{2}-\mathrm{CH}_{3}$
4. $\mathrm{CH}_{3}-\mathrm{CH}_{2}-\mathrm{O}-\mathrm{CO}-\mathrm{CH}_{3}$
5. $\mathrm{CH}_{3}-\mathrm{CH}_{2}-\mathrm{CH}_{2}-\mathrm{O}-\mathrm{CO}-\mathrm{H}$
6. $\mathrm{CH}_{3}-\mathrm{CH}\left(\mathrm{CH}_{3}\right)-\mathrm{O}-\mathrm{CO}-\mathrm{H}$
7. $\mathrm{CH}_{3}-\mathrm{CH}_{2}-\mathrm{CH}(\mathrm{OH})-\mathrm{CHO}$
8. $\mathrm{CH}_{3}-\mathrm{CH}(\mathrm{OH})-\mathrm{CH}_{2}-\mathrm{CHO}$
9. $\mathrm{CH}_{2}(\mathrm{OH})-\mathrm{CH}_{2}-\mathrm{CH}_{2}-\mathrm{CHO}$
10. $\mathrm{CH}_{2}(\mathrm{OH})-\mathrm{CH}\left(\mathrm{CH}_{3}\right)-\mathrm{CHO}$
11. $\mathrm{CH}_{3}-\mathrm{O}-\mathrm{CH}_{2}-\mathrm{CH}_{2}-\mathrm{CHO}$
12. $\mathrm{CH}_{3}-\mathrm{CH}_{2}-\mathrm{O}-\mathrm{CH}_{2}-\mathrm{CHO}$
13. $\mathrm{CH}_{3}-\mathrm{O}-\mathrm{CH}\left(\mathrm{CH}_{3}\right)-\mathrm{CHO}$
14. $\mathrm{CH}_{3}-\mathrm{CH}_{2}-\mathrm{CO}-\mathrm{CH}_{2}-\mathrm{OH}$
15. $\mathrm{CH}_{3}-\mathrm{CH}(\mathrm{OH})-\mathrm{CO}-\mathrm{CH}_{3}$
16. $\mathrm{CH}_{2}(\mathrm{OH})-\mathrm{CH}_{2}-\mathrm{CO}-\mathrm{CH}_{3}$
17. $\mathrm{CH}_{3}-\mathrm{O}-\mathrm{CH}_{2}-\mathrm{CO}-\mathrm{CH}_{3}$
18. $\mathrm{CH}_{3}-\mathrm{C}(\mathrm{OH})\left(\mathrm{CH}_{3}\right)-\mathrm{CHO}$
2.5 The possible structures are $3,4,5,6$.
2.6 The structure of the compound C is $\mathrm{CH}_{3}-\mathrm{CH}_{2}-\mathrm{O}-\mathrm{CO}-\mathrm{CH}_{3}$.

## PROBLEM 3

In a chemical factory in which formaldehyde is produced by oxidation of methanol, aqueous solutions containing methanol and formaldehyde are to be analyzed. In order to test the method, experiments are first carried out with known amounts of both methanol and formaldehyde. The following aqueous solutions are used:
Methanol, $5.00 \mathrm{~g} \mathrm{dm}^{-3}$
Formaldehyde, $5.00 \mathrm{~g} \mathrm{dm}^{-3}$
Potassium dichromate, $3.000 \times 10^{-2} \mathrm{~mol} \mathrm{dm}^{-3}$
Ammonium iron(II) sulphate, $0.2000 \mathrm{~mol} \mathrm{dm}^{-3}$
lodine, $0.1000 \mathrm{~mol} \mathrm{dm}^{-3}$
Sodium thiosulphate, $0.2000 \mathrm{~mol} \mathrm{dm}^{-3}$.
I. $\quad 10.00 \mathrm{~cm}^{3}$ methanol solution and $100.00 \mathrm{~cm}^{3}$ potassium dichromate solution are mixed, approximately $100 \mathrm{~cm}^{3}$ concentrated sulphuric acid is added and the solution is allowed to stand for about 30 minutes. Excess dichromate ions are then titrated with iron(II) ions with diphenylamine sulphonic acid as a redox indicator (colour change from red-violet to pale green). The volume of the iron(II) solution consumed is $43.5 \mathrm{~cm}^{3}$.
II. $\quad 10.00 \mathrm{~cm}^{3}$ of formaldehyde solution and $50.00 \mathrm{~cm}^{3}$ of iodine solution are mixed. Sodium hydroxide solution is added to alkaline reaction and the mixture is left standing for about 10 minutes. Hydrochloric acid is then added to a neutral reaction, and the excess iodine is determined by titration with thiosulphate, with starch as an indicator. The volume of the thiosulphate solution required is $33.3 \mathrm{~cm}^{-3}$.
3.1 Using the analysis data in I and II calculate the reacting amounts and the molar ratios of methanol/dichromate ions and formaldehyde/iodine.
3.2 Write balanced equations for all reactions described in experiments I and II.
III. It is checked that iodine does not react with methanol. From a solution containing both methanol and formaldehyde, two $10.00 \mathrm{~cm}^{3}$ samples are taken.

One sample is mixed with $100.00 \mathrm{~cm}^{3}$ of potassium dichromate solution and concentrated sulphuric acid as in I. Excess dichromate ions consume $4.8 \mathrm{~cm}^{3}$ of iron(II) solution.

The other sample is mixed with $50.00 \mathrm{~cm}^{3}$ of iodine solution and treated as in II. Excess iodine consumes $16.50 \mathrm{~cm}^{3}$ of thiosulphate solution.
3.3 Give balanced equations for the reactions and calculate the contents of methanol and formaldehyde in the solution. Give your answer in $\mathrm{g} \mathrm{dm}^{-3}$.

## SOLUTION

3.1 Amounts of substance:

| methanol | 1.56 mol |
| :--- | :--- |
| dichromate ions | 3.00 mol |
| iron(II) ions | 8.70 mol |

Molar ratio methanol/dichromate: $1 \mathrm{~mol} \mathrm{CH}_{3} \mathrm{OH} \Rightarrow 1 \mathrm{~mol} \mathrm{Cr}_{2} \mathrm{O}_{7}^{2-}$
Amounts of substance:
formaldehyde $\quad 1.67 \mathrm{~mol}$
iodine $\quad 5.00 \mathrm{~mol}$
thiosulphate ions $\quad 6.66 \mathrm{~mol}$

Molar ratio formaldehyde/iodine: $1 \mathrm{~mol} \mathrm{HCHO} \Rightarrow 1 \mathrm{~mol} \mathrm{l}_{2}$
3.2 Chemical equations:
$\mathrm{CH}_{3} \mathrm{OH}+\mathrm{Cr}_{2} \mathrm{O}_{7}^{2-}+8 \mathrm{H}^{+} \rightarrow \mathrm{CO}_{2}+2 \mathrm{Cr}^{3+}+6 \mathrm{H}_{2} \mathrm{O}$
$\mathrm{Cr}_{2} \mathrm{O}_{7}^{2-}+6 \mathrm{Fe}^{2+}+14 \mathrm{H}^{+} \rightarrow 2 \mathrm{Cr}^{3+}+6 \mathrm{Fe}^{3+}+7 \mathrm{H}_{2} \mathrm{O}$
$\mathrm{I}_{2}+2 \mathrm{OH}^{-} \rightarrow \mathrm{IO}^{-}+\mathrm{I}^{-}+\mathrm{H}_{2} \mathrm{O}$
$\mathrm{HCHO}+\mathrm{IO}^{-}+\mathrm{OH}^{-} \rightarrow \mathrm{HCOO}^{-}+\mathrm{I}^{-}+\mathrm{H}_{2} \mathrm{O}$
$\mathrm{IO}^{-}+\mathrm{I}^{-}+2 \mathrm{H}^{+} \rightarrow \mathrm{I}_{2}+\mathrm{H}_{2} \mathrm{O}$
$\mathrm{I}_{2}+2 \mathrm{~S}_{2} \mathrm{O}_{3}^{2-} \rightarrow 2 \mathrm{I}^{-}+\mathrm{S}_{4} \mathrm{O}_{6}^{2-}$
In (3), (5), and (6), $\mathrm{I}_{3}$ may participate instead of $\mathrm{I}_{2}$.
As an alternative to (4)
$\mathrm{HCHO}+\mathrm{I}_{2}+2 \mathrm{OH}^{-} \rightarrow \mathrm{HCOO}^{-}+2 \mathrm{I}^{-}+\mathrm{H}_{2} \mathrm{O}$ is acceptable.
3.3 Chemical equations

To the chemical equations above is added

$$
3 \mathrm{HCHO}+2 \mathrm{Cr}_{2} \mathrm{O}_{7}^{2-}+16 \mathrm{H}^{+} \rightarrow 3 \mathrm{CO}_{2}+4 \mathrm{Cr}^{3+}+11 \mathrm{H}_{2} \mathrm{O}
$$

Content of methanol: $\quad 1.9 \mathrm{~g} \mathrm{dm}^{-3}$
Content of formaldehyde: $\quad 10.1 \mathrm{~g} \mathrm{dm}^{-3}$

## PROBLEM 5

lodine is soluble to a certain extent in pure water. It is, however, more soluble in solutions containing iodide ions. By studying the total solubility of iodine as a function of iodide concentration, the equilibrium constants of the following reactions can be determined: Equation Equilibrium constants

| $\mathrm{I}_{2}(\mathrm{~s})$ | $\rightleftharpoons \mathrm{I}_{2}(\mathrm{aq})$ | $k_{1}$ | $(1)$ |
| :--- | :--- | :--- | :--- |
| $\mathrm{I}_{2}(\mathrm{~s})+I^{-}(\mathrm{aq})$ | $\rightleftharpoons I_{3}^{-}(\mathrm{aq})$ | $k_{2}$ | $(2)$ |
| $\mathrm{I}_{2}(\mathrm{aq})+\mathrm{I}^{-}(\mathrm{aq})$ | $\rightleftharpoons I_{3}^{-}(\mathrm{aq})$ | $k_{3}$ | $(3)$ |

5.1 Give the equilibrium equations for (1) - (3).

Solutions of known potassium iodide concentration $[1]_{\text {tot }}$ were equilibrated with solid iodine. Subsequent titration with sodium thiosulphate solution served to determine the total solubility of iodine $\left[I_{2}\right]_{\text {tot }}$.
The experiments yielded the following results:

| $[I]_{\text {tot }} / \mathrm{mmol} \mathrm{dm}^{-3}$ | 10.00 | 20.00 | 30.00 | 40.00 | 50.00 |
| :--- | :--- | :--- | :--- | :--- | :--- |
| $[I]_{\text {tot }} / \mathrm{mmol} \mathrm{dm}^{-3}$ | 5.85 | 10.53 | 15.11 | 19.96 | 24.82 |

5.2 Plot $\left[I_{2}\right]_{\text {tot }}$ versus $[1]_{\text {tot }}$ in a diagram.
5.3 Derive a suitable algebraic expression relating $\left[I_{2}\right]_{\text {tot }}$ and $[1]_{\text {tot }}$.
5.4 Use the graph to determine values of the equilibrium constants $k_{1}, k_{2}$, and $k_{3}$.

## SOLUTION

5.1 Equilibrium equations

The following relations are valid for the concentrations of the aqueous solutions:
$\left[I_{2}\right]=k_{1}$
$\frac{\left[\mathrm{I}_{3}^{-}\right]}{\left[\mathrm{I}^{-}\right]}=k_{2}$
$\frac{\left[\mathrm{I}_{3}\right]}{\left[\mathrm{I}_{2}\right]\left[\mathrm{I}^{-}\right]}=k_{3}=\frac{k_{2}}{k_{1}}$

### 5.2 See diagram on the next page.

5.3 The relation between $\left[I_{2}\right]_{\text {tot }}$ and $[1]_{\text {tot }}$ is as follows:
$\left[I_{2}\right]_{\text {tot }}=k_{1}+\frac{k_{2}}{1+k_{2}}\left[\mathrm{I}^{-}\right]_{\text {tot }}$
$5.4 k_{1}=1.04 \times 10^{-3} \mathrm{~mol} \mathrm{dm}^{-3} \quad k_{2}=0.90 \quad k_{3}=8.6 \times 10^{2} \mathrm{~mol}^{-1} \mathrm{dm}^{3}$
(These values are calculated by the least square method.)

## PROBLEM 7

Calcium oxalate, $\mathrm{CaC}_{2} \mathrm{O}_{4} \cdot \mathrm{H}_{2} \mathrm{O}$, is a sparingly soluble salt of analytical and physiological importance. The solubility product is $2.1 \times 10^{-9}$ at $25^{\circ} \mathrm{C}$. Oxalate ions can protolyse to form hydrogen oxalate ions and oxalic acid. The $p K_{a}$ values at $25{ }^{\circ} \mathrm{C}$ are $1.23\left(\mathrm{H}_{2} \mathrm{C}_{2} \mathrm{O}_{4}\right)$ and $4.28\left(\mathrm{HC}_{2} \mathrm{O}_{4}^{-}\right)$. At $25{ }^{\circ} \mathrm{C}$ the ionic product of water is $1.0 \times 10^{-14}$.
7.1 State those expressions for the equilibrium conditions which are of interest for the calculation of the solubility of calcium oxalate monohydrate.
7.2 State the concentration conditions which are necessary for the calculation of the solubility $s$ (in mol dm ${ }^{-3}$ ) of calcium oxalate in a strong acid of concentration $C$.
7.3 Calculate the solubility (in $\mathrm{g} \mathrm{dm}^{-3}$ ) of calcium oxalate monohydrate in a plant cell in which the buffer system regulates the pH to 6.5.
7.4 Calculate the solubility (in $\mathrm{g} \mathrm{dm}^{-3}$ ) of calcium oxalate monohydrate in hydrochloric acid with a concentration of $0.010 \mathrm{~mol} \mathrm{dm}^{-3}$. Give the concentration of hydrogen ions in the solution.
7.5 Calculate the equilibrium concentrations of all other species in solution d).

## SOLUTION

$7.1\left[\mathrm{Ca}^{2+}\right]\left[\mathrm{C}_{2} \mathrm{O}_{4}^{2 \cdot}\right]=K_{s}$
$\left[\mathrm{H}^{+}\right]\left[\mathrm{OH}^{-}\right]=K_{w}$

$$
\begin{equation*}
\frac{\left[\mathrm{H}^{+}\right]\left[\mathrm{HC}_{2} \mathrm{O}_{4}^{-}\right]}{\left[\mathrm{H}_{2} \mathrm{C}_{2} \mathrm{O}_{4}\right]}=K_{\mathrm{a} 1} \tag{3}
\end{equation*}
$$

$$
\begin{equation*}
\frac{\left[\mathrm{H}^{+}\right]\left[\mathrm{C}_{2} \mathrm{O}_{4}^{2-}\right]}{\left[\mathrm{HC}_{2} \mathrm{O}_{4}^{-}\right]}=K_{\mathrm{a} 2} \tag{1}
\end{equation*}
$$

$7.2 s=\left[\mathrm{Ca}^{2+}\right]=\left[\mathrm{C}_{2} \mathrm{O}_{4}^{2-}\right]+\left[\mathrm{HC}_{2} \mathrm{O}_{4}^{-}\right]+\left[\mathrm{H}_{2} \mathrm{C}_{2} \mathrm{O}_{4}\right]$
$C=\left[\mathrm{H}^{+}\right]+\left[\mathrm{HC}_{2} \mathrm{O}_{4}^{-}\right]+2\left[\mathrm{H}_{2} \mathrm{C}_{2} \mathrm{O}_{4}\right]-\left[\mathrm{OH}^{-}\right]$
Equations (5) or (6) may be replaced by

$$
\begin{equation*}
\left[\mathrm{H}^{+}\right]+2\left[\mathrm{Ca}^{2+}\right]=\left[\mathrm{HC}_{2} \mathrm{O}_{4}^{-}\right]+2\left[\mathrm{C}_{2} \mathrm{O}_{4}^{2-}\right]+\left[\mathrm{OH}^{-}\right]+\mathrm{C} \tag{7}
\end{equation*}
$$

7.3 The solubility of calcium oxalate monohydrate is $6.7 \times 10^{-3}$. (Calculated according to equation (8) ).
7.4 Elimination of the concentrations of oxalate species using equations (1), (3), and (4) yields the following expressions for (5) and (6). (The concentration of hydroxide ions can be neglected.)

$$
\begin{align*}
& s_{2}=K_{s}+\frac{\left[\mathrm{H}^{+}\right] K_{s}}{K_{\mathrm{a} 2}}+\frac{\left[\mathrm{H}^{+}\right]^{2} K_{s}}{K_{\mathrm{a} 1} K_{\mathrm{a} 2}}  \tag{8}\\
& C=\left[\mathrm{H}^{+}\right]+\frac{\left[\mathrm{H}^{+}\right] K_{s}}{s K_{\mathrm{a} 2}}+\frac{2\left[\mathrm{H}^{+}\right]^{2} K_{s}}{s K_{\mathrm{a} 1} K_{\mathrm{a} 2}} \tag{9}
\end{align*}
$$

Elimination of $s$ from (8) and (9) results in $4^{\text {th }}$ order equation. For this reason, an iterative method is to be preferred. The first approximation is $\left[\mathrm{H}^{+}\right]=C$. This value of $\left[\mathrm{H}^{+}\right]$can be used to calculate:
i) solubility $s$ from (8),
ii) the last two terms in (9), which are corrections. Now a new value for $\left[\mathrm{H}^{+}\right]$obtained from (9) may be used as a starting value for the next approximation. Two repeated operations give the following value for $s$ :

$$
s=6.6 \times 10^{-4} \mathrm{~mol} \mathrm{dm}^{-3}=9.6 \times 10^{-2} \mathrm{~g} \mathrm{dm}^{-3}
$$

$$
\left[\mathrm{H}^{+}\right]=9.3 \times 10^{-3} \mathrm{~mol} \mathrm{dm}^{-3}
$$

$7.5\left[\mathrm{Ca}^{2+}\right]=6.6 \times 10^{-4} \mathrm{~mol} \mathrm{dm}^{-3}$

$$
\left[\mathrm{Cl}^{-}\right]=0.010 \mathrm{~mol} \mathrm{dm}^{-3}
$$

$$
\left[\mathrm{OH}^{-}\right]=1.1 \times 10^{-12} \mathrm{~mol} \mathrm{dm}^{-3}
$$

$$
\begin{aligned}
& {\left[\mathrm{C}_{2} \mathrm{O}_{4}^{2-}\right]=3.2 \times 10^{-6} \mathrm{~mol} \mathrm{dm}^{-3}} \\
& {\left[\mathrm{HC}_{2} \mathrm{O}_{4}^{-}\right]=5.7 \times 10^{-4} \mathrm{~mol} \mathrm{dm}^{-3}} \\
& {\left[\mathrm{H}_{2} \mathrm{C}_{2} \mathrm{O}_{4}\right]=9.0 \times 10^{-5} \mathrm{~mol} \mathrm{dm}^{-3}}
\end{aligned}
$$

## PROBLEM 3

A sample containing a mixture of sodium chloride and potassium chloride weights 25 g . After its dissolution in water 840 ml of $\mathrm{AgNO}_{3}$ solution ( $c=0.5 \mathrm{~mol} \mathrm{dm}^{-3}$ ) is added. The precipitate is filtered off and a strip of copper weighing 100.00 g is dipped into the filtrate. After a given time interval the strip weights 101.52 g .

Calculate the mass percent composition of the mixture.

## SOLUTION

$$
\begin{array}{lc}
A_{r}(\mathrm{Cu})=63.5 \\
\mathrm{Cu}+2 \mathrm{AgNO}_{3} \rightarrow & A_{r}(\mathrm{Ag})=108 \\
\mathrm{y} & \mathrm{Cu}\left(\mathrm{NO}_{3}\right)_{2}+2 \mathrm{Ag} \\
\mathrm{x}
\end{array}
$$

$x=$ the quantity of deposited silver
$y=$ the quantity of dissolved copper
$\frac{63.5}{y}=\frac{2 \times 108}{x}$
$x-y=101.52-100 \quad x=1.52+y$
$\frac{63.5}{y}=\frac{2 \times 108}{1.52+x} \quad y=0.63 \quad x=2.15 \mathrm{~g} \mathrm{Ag}^{+}$
Mass of silver nitrate:

$$
\begin{aligned}
& \frac{840}{1000} \times 0.5 \times 170=71.4 \mathrm{~g} \mathrm{AgNO}_{3} \\
& \frac{170 \mathrm{~g} \mathrm{AgNO}_{3}}{108 \mathrm{~g} \mathrm{Ag}}=\frac{71.4}{x} \quad x=45.36 \mathrm{~g} \mathrm{Ag}^{+}
\end{aligned}
$$

Silver consumed for participation
$45.36-2.15=43.21 \mathrm{~g} \mathrm{Ag}^{+}$

Total mass of chloride
$\frac{108 \mathrm{~g} \mathrm{Ag}^{+}}{35.5 \mathrm{~g} \mathrm{Cl}^{-}}=\frac{43.2}{\mathrm{x}} \quad \mathrm{x}=14.2 \mathrm{~g} \mathrm{Cl}^{-}$
$M_{r}(\mathrm{NaCl})=58.5 \quad M_{r}(\mathrm{KCl})=74.6$
$x=$ mass of NaCl in the mixture
$y=$ mass of KCl in the mixture
mass of $\mathrm{Cl}^{-}$in $\mathrm{NaCl}: \frac{35.5 \mathrm{x}}{58.5}$
mass of $\mathrm{Cl}^{-}$in $\mathrm{KCl}: \frac{35.5 \mathrm{y}}{74.6}$
$\frac{35.5 x}{58.5}+\frac{35.5 y}{74.6}=14.2$
$x+y=25$
$x=17.6 \mathrm{~g} \mathrm{NaCl} \quad 70.4 \% \mathrm{NaCl}$
$y=7.4 \mathrm{~g} \mathrm{KCl} \quad 29.6 \% \mathrm{KCl}$

## PROBLEM 3

A weak acid of total concentration $2 \times 10^{-2} \mathrm{M}$ is dissolved in a buffer of $\mathrm{pH}=8.8$. The anion $A^{-}$of this acid is coloured and has a molar decadic absorption coefficient $\varepsilon$ of $2.1 \times 10^{4} \mathrm{~cm}^{2} \mathrm{~mol}^{-1}$. A layer $l$ of the solution with 1.0 cm thickness absorbs 60 percent of the incident luminous intensity $I_{0}$.
3.1 What is the equation relating the extinction to the thickness of the absorbing layer?
3.2 How large is the concentration of the acid anion in the buffer solution?
3.3 How large is the $\mathrm{p} K_{a}$ of the acid?

## SOLUTION

### 3.1 The Lambert-Beer law e.g.:

$$
\log (I / I)=A=\varepsilon . c . I
$$

$3.2 \log [(100-60) / 100]=-2.1 \times 10^{4} \times[A] \times 1$

$$
[A]=1.895 \times 10^{-5} \mathrm{~mol} \mathrm{~cm}^{-3}=1.895 \times 10^{-2} \mathrm{~mol} \mathrm{dm}^{-3}
$$

3.3 According to the Henderson-Hasselbalch equation:

$$
\mathrm{pH}=p K_{a}+\log \frac{\left[\mathrm{A}^{-}\right]_{\mathrm{eq}}}{[\mathrm{HA}]_{\mathrm{eq}}}
$$

and with the total concentration
$[\mathrm{HA}]_{\text {tot }}=[\mathrm{HA}]_{\text {eq }}+[\mathrm{A}]_{\text {eq }}=2 \times 10^{-2} \mathrm{~mol} \mathrm{dm}^{-3}$
$8.8=p K_{a}+\log \frac{1.895 \times 10^{-2}}{2 \times 10^{-2}-1.895 \times 10^{-2}}$
$p K_{a}=7.5$

## PROBLEM 4

$15 \mathrm{~cm}^{3}$ of a gaseous hydrocarbon $\mathrm{C}_{x} \mathrm{H}_{y}$ are mixed with $120 \mathrm{~cm}^{3}$ oxygen and ignited. After the reaction the burned gases are shaken with concentrated aqueous KOH solution. A part of the gases is completely absorbed while $67.5 \mathrm{~cm}^{3}$ gases remain. It has the same temperature and pressure as the original unburned mixture.
4.1 What is the composition of the remaining gas? Explain.
4.2 How large is the change in the amount of substance per mole of a hydrocarbon $C_{x} H_{y}$ when this is burned completely?
4.3 What is the chemical formula of the hydrocarbon used for the experiment? Give the steps of the calculation.

## SOLUTION

4.1 The remaining gas is oxygen since the burning products $\mathrm{CO}_{2}$ and $\mathrm{H}_{2} \mathrm{O}$ are completely absorbed in concentrated KOH solution.
4.2 The general stoichiometric equation for complete combustion of a hydrocarbon $\mathrm{C}_{x} \mathrm{H}_{y}$ is as follows:
$\mathrm{C}_{\mathrm{x}} \mathrm{H}_{\mathrm{y}}+(\mathrm{x}+\mathrm{y} / 4) \mathrm{O}_{2} \rightarrow \mathrm{xCO} \mathrm{CO}_{2}+(\mathrm{y} / 2) \mathrm{H}_{2} \mathrm{O}$
The change in amount of substance per mole of hydrocarbon is $[x+(y / 2)-(1+x+y / 4)] \mathrm{mol}=[(y / 4)-1] \mathrm{mol}$
4.3 The equation of chemical conversion at the experimental condition is as follows:
$15 \mathrm{C}_{\mathrm{x}} \mathrm{H}_{\mathrm{y}}+120 \mathrm{O}_{2} \rightarrow 15 \mathrm{XCO}_{2}+(15 / 2) \mathrm{y} \mathrm{H}_{2} \mathrm{O}+\left[(120-15 \mathrm{x}-(15 / 4) \mathrm{y}] \mathrm{O}_{2}\right.$

For the residual oxygen:
(1)

$$
120 / b-15 x-(15 / 4) y=67.5
$$

and for the total balance of amount of substance:

$$
\begin{equation*}
15 x+(15 / 2) y+67.5=15+120+15[(y / 4)-1] \tag{2}
\end{equation*}
$$

From equation (1) and (2) follows: $x=2$ and $y=6$.
The hydrocarbon in question is ethane.

## THE SEVENTEENTH <br> INTERNATIONAL CHEMISTRY OLYMPIAD <br> 1-8 JULY 1985, BRATISLAVA, CZECHOSLOVAKIA

## THEORETICAL PROBLEMS

## PROBLEM 1

A solution was formed from 0.5284 g of a sample of an alloy containing aluminium. The aluminium was then precipitated as aluminium 8-hydroxyquinolate. The precipitate was separated, dissolved in hydrochloric acid and the 8-hydroxyquinoline formed was titrated with a standard solution of potassium bromate containing potassium bromide. The concentration of the standard potassium bromate solution was 0.0200 M and $17.40 \mathrm{~cm}^{3}$ of it were required. The resultant product is a dibromo derivative of 8-hydroxyquinoline.

The structural formula of 8-hydroxiquinoline is:

The relative atomic mass of aluminium is 26.98 .

## Problems:

1.1 Write the balanced equation for the reaction of the aluminium (III) ion with 8-hydroxyquinoline, showing clearly the structure of the products.
1.2 Give the name of the type of compound which is formed during the precipitation.
1.3 Write the balanced equation for the reaction in which bromine is produced.
1.4 Write the balanced equation for the reaction of bromine with 8 -hydroxyquinoline.
1.5 Calculate the molar ratio of aluminium ions to bromate ions.
1.6 Calculate the percentage by weight of aluminium in the alloy.

## SOLUTION

1.1

1.2 Chelate

## 1.3

$$
\mathrm{BrO}_{3}^{-}+5 \mathrm{Br}^{-}+6 \mathrm{H}^{+} \rightarrow 3 \mathrm{Br}_{2}+3 \mathrm{H}_{2} \mathrm{O}
$$

1.4

1.5 As $\mathrm{Al} \hat{=} \mathrm{Al}(\text { oxine })_{3} \hat{=} 3$ oxine $\hat{=} 12 \mathrm{Br} \hat{=} 12 \mathrm{e}$, the chemical equivalent of Al equals 26.98/12 $=2.248$.
1.6 The percentage of the aluminium in the sample is $\% \mathrm{Al}=\frac{17.40 \times 0.1000 \times 2.248 \times 100}{528.4}=0.74$

The alloy contains $0.74 \%$ of aluminium.

## PROBLEM 3

Calcium sulphate is a sparingly soluble compound. Its solubility product is given by:

$$
K_{s}\left(\mathrm{CaSO}_{4}\right)=\left[\mathrm{Ca}^{2+}\right]\left[\mathrm{SO}_{4}^{2-}\right]=6.1 \times 10^{-5}
$$

Ethylenediaminetetraacetic acid (EDTA) has the formula $\mathrm{C}_{10} \mathrm{H}_{16} \mathrm{~N}_{2} \mathrm{O}_{8}$ and the structure:

The anion of this acid, $\mathrm{C}_{10} \mathrm{H}_{12} \mathrm{~N}_{2} \mathrm{O}_{8}{ }^{4-}$, forms a stable complex $\mathrm{CaC}_{10} \mathrm{H}_{12} \mathrm{~N}_{2} \mathrm{O}_{8}{ }^{2-}$ with calcium ions. The stability constant of this complex ion is given by:

$$
K=\frac{\left[\mathrm{CaC}_{10} \mathrm{H}_{12} \mathrm{~N}_{2} \mathrm{O}_{8}^{2}\right]}{\left[\mathrm{Ca}^{2}\right]\left[\mathrm{C}_{10} \mathrm{H}_{12} \mathrm{~N}_{2} \mathrm{O}_{8}^{4}\right]}=1.0 \times 10^{11}
$$

EDTA is completely dissociated in strongly alkaline solution. The equation for this dissociation is:

$$
\mathrm{C}_{10} \mathrm{H}_{16} \mathrm{~N}_{2} \mathrm{O}_{8} \rightarrow 4 \mathrm{H}^{+}+\mathrm{C}_{10} \mathrm{H}_{12} \mathrm{~N}_{2} \mathrm{O}_{8}{ }^{4-}
$$

## Problems:

3.1 Calculate the concentration of calcium ions in a saturated solution of calcium sulphate.
3.2 Calculate the concentration of free $\mathrm{Ca}^{2+}$ cations in a solution of 0.1 M $\mathrm{Na}_{2}\left(\mathrm{CaC}_{10} \mathrm{H}_{12} \mathrm{~N}_{2} \mathrm{O}_{8}\right)$. You should ignore any protonation of the ligand.
3.3 How many moles of calcium sulphate will dissolve in 1 litre of a strongly alkaline solution of $0.1 \mathrm{M} \mathrm{Na}_{4} \mathrm{C}_{10} \mathrm{H}_{12} \mathrm{~N}_{2} \mathrm{O}_{8}$ ?
What would be the concentrations of the calcium and sulphate ions in the resulting solution?
3.4 Suggest a structure for the complex ion $\left[\mathrm{CaC}_{10} \mathrm{H}_{12} \mathrm{~N}_{2} \mathrm{O}_{8}\right]^{2-}$ assuming that it is approximately octahedral.
3.5 Is the structure you have suggested in 4) optically active?

If your answer is "yes" then draw the structure of the other optical isomer enantiomer).
3.6 Explain why the complexes formed by the anion $\mathrm{C}_{10} \mathrm{H}_{12} \mathrm{~N}_{2} \mathrm{O}_{8}^{4-}$ are exceptionally table.

## SOLUTION

$3.1\left[\mathrm{Ca}^{2+}\right]=7.8 \times 10^{-3} \mathrm{~mol} \mathrm{dm}^{-3}$
$3.2\left[\mathrm{Ca}^{2+}\right]=1.0 \times 10^{-6} \mathrm{~mol} \mathrm{dm}^{-3}$
3.3 The $\mathrm{CaSO}_{4}$ amount dissolved is 0.1 mol.
$\left[\mathrm{SO}_{4}{ }^{2}\right]=0.10 \mathrm{~mol} \mathrm{dm}{ }^{-3}$.
$\left[\mathrm{Ca}^{2+}\right]=6.1 \times 10^{-4} \mathrm{~mol} \mathrm{dm}^{-3}$

## $3.4+3.5$

The complex is optically active. The structures of both enantiomers are

3.6 The high number of the chelate rings. Other factors also contribute to the complex ability, e.g. the character of the donor atoms, the magnitude and distribution of the charges in the anion, etc.

## PROBLEM 8

The following reaction scheme represents part of anaerobic degradation of saccharides, i.e. the glycolysis, involving equilibrium constants $K_{1}$ and $K_{2}$ :
glucose-1-phosphate $\rightleftharpoons$ glucose-6-phosphate $K_{1}=19$
glucose-6-phosphate $\rightleftharpoons$ fructose-6-phosphate $K_{2}=0.50$

## Problems:

8.1 Give the structural formulae for all the three reactants (compounds) that are mutually interconverted, i.e. $\alpha$-D-glucose-1-phosphate, $\alpha$-D-glucose-6-phosphate and $\alpha$-D-fructose-6-phosphate.
8.2 In the beginning of the reaction the reaction mixture contained 1 mmol of glucose-6-phosphate. Calculate the amounts of glucose-6-phosphate, glucose-1-phosphate and fructose-6-phosphate in the mixture at equilibrium. (As the reaction take place in a constant volume, the ratio of the amounts of substances equals that of their concentrations.)

## SOLUTION

## 8.1

$\alpha$-D-glucose-1-phosphate

$\alpha$-D-fructose-6-phosphate

8.2 It holds for the equilibrium constant of the successive reactions, that
$\frac{\text { Fru-6-P }}{\text { Glc-1-P }}=19 \times 0.5=9.5$
If $y$ mmoles of Glc-6-phosphate are converted into the same number of Glc-1-phosphate and another x mmoles of Glc-6-phosphate are converted into the same number of mmoles of Fru-6-phosphate, then ( $1-x-y$ ) mmoles of Glc-6-phosphate remain in the reaction mixture at equilibrium. It follows from relationship (i) that
Glc-1-phosphate $=y \quad x / y=9.5$
Fru-6-phosphate $=x \quad x=9.5 y$
After substituting,
Glc-6-phosphate $=1-x-y=1-10.5 y$,
it is possible to write for the reaction mixture at equilibrium that

$$
\begin{aligned}
& \frac{\text { Glc-6-P }}{\text { Glc-1-P }}=\frac{1-10.5 y}{y}=19 \quad 1-10.5 y=19 y \\
& y=1 / 29.5=0.034 \text { mmoles Glc-1-phoshate }
\end{aligned}
$$

It is further calculated that

$$
x=9.5 y=9.5 \times 0.034 \text { or } 9.5 / 29.5=0.322 \text { mmoles of Fru-6-phosphate }
$$

$1-x-y=1-0.322-0.034=0.644$ mmoles of Glc-6-phosphate
At equilibrium the reaction mixture contains 0.034 mmoles Glc-1-phosphate, 0.644 mmoles Glc-6-phosphate and 0.322 mmoles Fru-6-phosphate.

## PROBLEM 2

500 mg of a hydrated sodium salt of phosphoric acid are dissolved in $50.0 \mathrm{~cm}^{3}$ of 0.1 molar sulphuric acid. This solution is diluted with distilled water to $100.0 \mathrm{~cm}^{3}$ and $20.0 \mathrm{~cm}^{3}$ of it are titrated with 0.100 molar NaOH solution using thymolphthalein as indicator. The average of the burette reading is $26.53 \mathrm{~cm}^{3}$. The pH at the end-point is 10.00 .

## Problems:

2.1 Calculate the percentage distribution by moles of all protonated $\mathrm{H}_{n} \mathrm{PO}_{4}{ }^{n-3}$ species at the end-point.
2.2 What is the stoichiometric formula of the salt?

The cumulative protonation constants are given by
$\beta_{n}=\frac{\left[\mathrm{H}_{n} \mathrm{PO}_{4}^{\mathrm{n}-3}\right]}{\left[\mathrm{PO}_{4}^{3-}\right]\left[\mathrm{H}^{+}\right]^{n}}$
where $\log \beta_{1}=11.70 ; \quad \log \beta_{2}=18.6 ; \quad \log \beta_{3}=20.6$.
The relative atomic masses are: $\mathrm{Na}=23.0 ; \quad \mathrm{P}=31.0 ; \quad \mathrm{H}=1.0 ; \quad \mathrm{O}=16.0$.

## SOLUTION

$2.1\left[\mathrm{H}_{3} \mathrm{PO}_{4}\right]+\left[\mathrm{HPO}_{4}{ }^{2}\right]+\left[\mathrm{H}_{2} \mathrm{PO}_{4}\right]+\left[\mathrm{PO}_{4}{ }^{3-}\right]=\mathrm{T}_{\text {konst }} ; \quad\left[\mathrm{H}^{+}\right]=10^{-10} \mathrm{~mol} \mathrm{dm}{ }^{-3}$
$\left[\mathrm{H}_{3} \mathrm{PO}_{4}\right]=1 \mathrm{~mol} \mathrm{dm}^{-3}$
$\left[\mathrm{HPO}_{4}{ }^{2}\right]=\beta_{1}\left[\mathrm{PO}_{4}{ }^{3-}\right]\left[\mathrm{H}^{+}\right]=1.25 \times 10^{10} \mathrm{~mol} \mathrm{dm}^{-3}=97.97 \%$
$\left[\mathrm{H}_{2} \mathrm{PO}_{4}\right]=\beta_{2}\left[\mathrm{PO}_{4}^{3-}\right]\left[\mathrm{H}^{+}\right]^{2}=1 \times 10^{8} \mathrm{~mol} \mathrm{dm}^{-3} \quad=0.078 \%$
$\left[\mathrm{PO}_{4}{ }^{3}\right]=\left(\beta_{3}\left[\mathrm{H}^{+}\right]^{3}\right)^{-1}=2.5 \times 10^{9} \mathrm{~mol} \mathrm{dm}^{-3} \quad=1.955 \%$

### 2.2 A general formula of the salt: $\mathrm{Na}_{3-n}\left(\mathrm{H}_{n} \mathrm{PO}_{4}\right) \times \mathrm{m} \mathrm{H}_{2} \mathrm{O} \quad(\mathrm{n}=0,1,2)$

The titrated solution contains $100 \mathrm{mg}(\mathrm{y} \mathrm{mol})$ of the salt and 1.00 mmol of sulphuric acid. The reacted protons (in mmol) can be calculated using the results of a):
$2+(n-0.9797-2 \times 0.00078) \mathrm{y}=2.653$
Since $y=100 / M$ (in mmol) but $M \geq 120 \mathrm{~g} \mathrm{~mol}^{-1}$, the only real solution is $\mathrm{n}=2$.
Therefore $\mathrm{M}=156 \mathrm{~g} \mathrm{~mol}^{-1}, \mathrm{~m}$ is $(156-120) / 18=2 \quad \Rightarrow \mathrm{NaH}_{2} \underline{\mathrm{PO}}_{4} \cdot 2 \mathrm{H}_{2} \underline{O}$

## PROBLEM 3

$25.00 \mathrm{~cm}^{3}$ of a neutral solution containing potassium chloride and potassium cyanide are potentiometrically titrated with a standard 0.1000 molar silver nitrate solution at $25{ }^{\circ} \mathrm{C}$ using a silver electrode and a normal calomel half-cell with $\mathrm{KNO}_{3}$ - salt bridge. The protonation of cyanide ions is negligible. The potentiometric curve obtained (emf (V)) vs. burette readings (in $\mathrm{cm}^{3}$ ) is shown in Fig. 1.

Fig. 1

3.1 The end points of the reactions taking place during the titration, are marked with $A, B$ and $C$. Write the balanced ionic equation for each reaction.
3.2 What volume of the titrant is required to reach point $B$ ?
3.3 Calculate the concentrations of KCl and KCN (in $\mathrm{mol} \mathrm{dm}^{-3}$ ) in the sample solution.
3.4 Calculate the emf readings at the points $A$ and $C$ in volts.
3.5 What is the molar ratio $\mathrm{Cl}^{-} / \mathrm{CN}^{-}$in the solution and in the precipitate at point C ?

Data:
$E^{0}\left(\mathrm{Ag}^{+} / \mathrm{Ag}\right)=0.800 \mathrm{~V}$
$E^{\circ}($ Calomel $)=0.285 \mathrm{~V}$
$K_{s p}(\mathrm{AgCN})=10^{-15.8}$
$K_{s p}(\mathrm{AgCl})=10^{-9.75}$
$\beta_{2}=\frac{\left[\mathrm{Ag}(\mathrm{CN})_{2}^{-}\right]}{\left[\mathrm{Ag}^{+}\right]\left[\mathrm{CN}^{-}\right]^{2}}=10^{21.1}$

## SOLUTION

$3.1 \beta_{2}$ indicates that the complexation of $\mathrm{Ag}^{+}$with $\mathrm{CN}^{-}$occurs easily. Thus A denotes the point where all $\mathrm{Ag}^{+}$is present in the complex form, having a higher potential than $\mathrm{Ag}^{+}, \mathrm{B}$ shows the point where the precipitation of AgCN starts, thus leading to a constant $\mathrm{Ag}^{+}$concentration until all $\mathrm{CN}^{-}$is precipitated. Now at point C the precipitation of the more soluble AgCl begins:
A: $\quad \mathrm{Ag}^{+}+2 \mathrm{CN}^{-} \rightarrow\left[\mathrm{Ag}(\mathrm{CN})_{2}\right]^{-}$
B: $\quad\left[\mathrm{Ag}(\mathrm{CN})_{2}\right]^{-}+\mathrm{Ag}^{+} \rightarrow 2 \mathrm{AgCN} \downarrow$
$\mathrm{C}: \mathrm{Ag}^{+}+\mathrm{Cl}^{-} \rightarrow \mathrm{AgCl} \downarrow$
$3.22 \times 2.47 \mathrm{~cm}^{3}=\underline{4.94 \mathrm{~cm}^{3}}$
$3.3\left[\mathrm{CN}^{-}\right]=(4.94 \times 0.1 \times 40) / 1000 \mathrm{~mol} \mathrm{dm}^{-3}=1.98 \times 10^{-2} \mathrm{~mol} \mathrm{dm}^{-3}$
$[\mathrm{Cl}]=((10-4.94) \times 0.1 \times 40) / 1000 \mathrm{~mol} \mathrm{dm}^{-3}=2.02 \times 10^{-2} \mathrm{~mol} \mathrm{dm}^{-3}$
3.4 For the system $\mathrm{Ag} / \mathrm{Ag}^{+}$at point $\mathrm{A}: ~ E=E_{o}+0.059 \log \left[\mathrm{Ag}^{+}\right]$.

The following equations are derived from the equilibrium conditions:
$\left[\mathrm{Ag}^{+}\right]=\frac{\left[\mathrm{Ag}\left(\mathrm{CN}^{-}\right)_{2}\right]}{\left[\mathrm{CN}^{-}\right]^{2} \beta_{2}}$
$\left[\mathrm{Ag}^{+}\right]+\left[\mathrm{Ag}\left(\mathrm{CN}^{-}\right)_{2}\right]=\frac{2.47 \times 0.1}{25+2.47}$
$\left[\mathrm{CN}^{-}\right]=2\left[\mathrm{Ag}^{+}\right]$
It yields an equation of third degree in $\left[\mathrm{Ag}^{+}\right]$:
$4 \beta_{2}\left[\mathrm{Ag}^{+}\right]^{3}+\left[\mathrm{Ag}\left(\mathrm{CN}^{-}\right)_{2}\right]=0$
$\left[\mathrm{Ag}\left(\mathrm{CN}^{-}\right)_{2}\right]$ can be assumed to be $(2.47 \times 0.1) / 27.47 \mathrm{~mol} \mathrm{dm}^{-3}$, and therefore $\left[\mathrm{Ag}^{+}\right]$ equals $1.213 \times 10^{-8} \mathrm{~mol} \mathrm{dm}^{-3}$.
The emf will be: $E=0.8+0.059 \log \left[\mathrm{Ag}^{+}\right]-0.285=\underline{0.048 \mathrm{~V}}$

At point $\mathrm{C}:[\mathrm{Ag}+]=\sqrt{K_{s p}(\mathrm{AgCl})}=1.333 \times 10^{-5}$ and
$E=0.8+0.059 \log \left[\mathrm{Ag}^{+}\right]-0.285=\underline{0.227 \mathrm{~V}}$
3.5 Since both AgCN and AgCl are present as the precipitate, the solution must be saturated:

In the solution: $[\mathrm{Cl}] /[\mathrm{CN}]=K_{\text {sp }}(\mathrm{AgCl}) / K_{\text {sp }}(\mathrm{AgCN})=10^{6.05}=\underline{1.222 \times 10^{6}}$
In the precipitate: $\quad n(A g C l) / n(A g C N)=2.02 / 1.98=\underline{1.02}$

## PROBLEM 4

Chloride ions are analytically determined by precipitating them with silver nitrate. The precipitate is undergoing decomposition in presence of light and forms elemental silver and chlorine. In aqueous solution the latter disproportionates to chlorate $(\mathrm{V})$ and chloride. With excess of silver ions, the chloride ions formed are precipitated whereas chlorate(V) ions are not.
4.1 Write the balanced equations of the reactions mentioned above.
4.2 The gravimetric determination yielded a precipitate of which $12 \%$ by mass was decomposed by light. Determine the size and direction of the error caused by this decomposition.
4.3 Consider a solution containing two weak acids HA and HL, 0.020 molar and 0.010 molar solutions, respectively. The acid constants are $1 \times 10^{-4}$ for HA and $1 \times 10^{-7}$ for HL. Calculate the pH of the solution.
4.4 M forms a complex ML with the acid $\mathrm{H}_{2} \mathrm{~L}$ with the formation constant $K_{1}$. The solution contains another metal ion N that forms a complex NHL with the acid $\mathrm{H}_{2} \mathrm{~L}$. Determine the conditional equilibrium constant, $K_{1}^{\prime}$ for the complex ML in terms of $\left[\mathrm{H}^{+}\right]$and $K$ values.
$K_{1}=\frac{[\mathrm{ML}]}{[\mathrm{M}][\mathrm{L}]}$
$K_{1^{\prime}}=\frac{[\mathrm{ML}]}{\left[\mathrm{M}^{\prime}\right]\left[\mathrm{L}^{\prime}\right]}$
[ $\left.M^{\prime}\right]=$ total concentration of M not bound in ML
[L'] = the sum of the concentrations of all species containing L except ML

In addition to $K_{1}$, the acid constants $K_{a 1}$ and $K_{a 2}$ of $\mathrm{H}_{2} \mathrm{~L}$ as well as the formation constant $K_{\text {NHL }}$ of NHL are known.
$K_{\mathrm{NHL}}=\frac{[\mathrm{NHL}]}{[\mathrm{N}][\mathrm{L}]\left[\mathrm{H}^{+}\right]}$
You may assume that the equilibrium concentration $\left[\mathrm{H}^{+}\right]$and $[\mathrm{N}]$ are known, too.

## SOLUTION

4.1 $\mathrm{Ag}^{+}+\mathrm{Cl}^{-} \rightarrow \mathrm{AgCl} \downarrow$
$2 \mathrm{AgCl} \rightarrow 2 \mathrm{Ag}+\mathrm{Cl}_{2}$
$3 \mathrm{Cl}_{2}+3 \mathrm{H}_{2} \mathrm{O} \rightarrow \mathrm{ClO}_{3}^{-}+5 \mathrm{Cl}^{-}+6 \mathrm{H}^{+}$
Total:
$6 \mathrm{AgCl}+3 \mathrm{H}_{2} \mathrm{O} \rightarrow 6 \mathrm{Ag}+\mathrm{ClO}_{3}^{-}+5 \mathrm{Cl}^{-}+6 \mathrm{H}^{+}$or
$3 \mathrm{Cl}_{2}+5 \mathrm{Ag}^{+}+3 \mathrm{H}_{2} \mathrm{O} \rightarrow \mathrm{ClO}_{3}^{-}+5 \mathrm{AgCl}+6 \mathrm{H}^{+}$
4.2 From 100 g AgCl 12 g decompose and 88 g remain. 12 g equals 0.0837 mol and therefore, $0.04185 \mathrm{~mol} \mathrm{Cl}_{2}$ are liberated. Out of that $(12 \times 107.9) / 143.3=9.03 \mathrm{~g} \mathrm{Ag}$ remain in the precipitate. $5 / 6 \times 0.837 \mathrm{~mol} \mathrm{AgCl}$ are newly formed $(=10.0 \mathrm{~g})$, so that the total mass of precipitate $(A)$ yields:
$\mathrm{A}=88 \mathrm{~g}+9.03 \mathrm{~g}+10.0 \mathrm{~g}=\underline{107.03 \mathrm{~g} ;}$; relative error $=\underline{\mathbf{7 . 0 3} \%}$
$4.3\left[\mathrm{H}^{+}\right]=[\mathrm{A}]+\left[\mathrm{L}^{-}\right]+\left[\mathrm{OH}^{-}\right]$
$[\mathrm{HA}]+\left[\mathrm{A}^{-}\right]=0.02 \mathrm{~mol} \mathrm{dm}^{-3} \mathrm{p} K(\mathrm{HA})=\mathrm{pH}+\mathrm{p}[\mathrm{A}-]-\mathrm{p}[\mathrm{HA}]=4$
$[\mathrm{HL}]+\left[\mathrm{L}^{-}\right]=0.01 \mathrm{~mol} \mathrm{dm}^{-3} \mathrm{p} K(\mathrm{HL})=\mathrm{pH}+\mathrm{p}[\mathrm{L}-]-\mathrm{p}[\mathrm{HL}]=7$
For problems like these, where no formal algebraic solution is found, only simplifications lead to a good approximation of the desired result, e.g.

1. $\left[\mathrm{H}^{+}\right]=[\mathrm{A}]$ (since HA is a much stronger acid than HL then $[\mathrm{A}] »\left[\mathrm{~L}^{-}\right]+\left[\mathrm{OH}^{-}\right]$)
$\left[\mathrm{H}^{+}\right]^{2}+K_{(\mathrm{HA)}}\left[\mathrm{H}^{+}\right]-K_{(\mathrm{HA})} 0.02=0$
$\left[\mathrm{H}^{+}\right]=1.365 \times 10^{-3} \mathrm{~mol} \mathrm{dm}^{-3}$
$\mathrm{pH}=\underline{2.865}$
2. Linear combination of the equations

$$
\begin{aligned}
& {[\mathrm{H}+]=K_{(\mathrm{HA})} \frac{[\mathrm{HA}]}{\left[\mathrm{A}^{-}\right]}=K_{(\mathrm{HL})} \frac{[\mathrm{HL}]}{\left[\mathrm{L}^{-}\right]} ;} \\
& {[\mathrm{HA}]=0.02-[\mathrm{A}] ;} \\
& {[\mathrm{HL}]=0.01-[\mathrm{L}] ;} \\
& {\left[\mathrm{H}^{+}\right]=\left[\mathrm{A}^{-}\right]+\left[\mathrm{L}^{-}\right]+[\mathrm{OH}]}
\end{aligned}
$$

yields:

$$
\begin{aligned}
& {[\mathrm{A}]=\frac{0.02 \times K_{(\mathrm{HA})}}{\left[\mathrm{H}^{+}\right]+K_{(\mathrm{HA})}}} \\
& {[\mathrm{L}]=\frac{0.01 \times K_{(\mathrm{HL})}}{\left[\mathrm{H}^{+}\right]+K_{(\mathrm{HL})}}} \\
& {\left[\mathrm{H}^{+}\right]=\frac{0.02 \times K_{(\mathrm{HA})}}{\left[\mathrm{H}^{+}\right]+K_{(\mathrm{HA})}}+\frac{0.01 \times K_{(\mathrm{HL})}}{\left[\mathrm{H}^{+}\right]+K_{(\mathrm{HL})}}+\frac{K_{w}}{\left[\mathrm{H}^{+}\right]}}
\end{aligned}
$$

The equation above can only be solved by numerical approximation methods. The result is $\mathrm{pH}=2.865$. We see that it is not necessary to consider all equations. Simplifications can be made here without loss of accuracy. Obviously it is quite difficult to see the effects of a simplification - but being aware of the fact that already the so-called exact solution is not really an exact one (e.g. activities are not being considered), simple assumption often lead to a very accurate result.

## 4.4

$$
\begin{aligned}
& K_{1^{\prime}}=\frac{[\mathrm{ML}]}{[\mathrm{M}]\left([\mathrm{L}]+[\mathrm{HL}]+[\mathrm{NHL}]+\left[\mathrm{H}_{2} \mathrm{~L}\right]\right)}=\frac{K_{1}[\mathrm{~L}]}{\left([\mathrm{L}]+[\mathrm{HL}]+[\mathrm{NHL}]+\left[\mathrm{H}_{2} \mathrm{~L}\right]\right)} \\
& {[\mathrm{HL}]=\frac{K_{\mathrm{a} 1}\left[\mathrm{H}_{2} \mathrm{~L}\right]}{[\mathrm{H}]}} \\
& {[\mathrm{HL}]=\frac{[\mathrm{L}][\mathrm{H}]}{K_{\mathrm{a} 2}}} \\
& {[\mathrm{~L}]=\frac{K_{\mathrm{a} 2}[\mathrm{HL}]}{[\mathrm{H}]}=\frac{K_{a 1} K_{\mathrm{a} 2}\left[\mathrm{H}_{2} \mathrm{~L}\right]}{[\mathrm{H}]^{2}}} \\
& {[\mathrm{NHL}]=K_{N H L}[\mathrm{~N}][\mathrm{L}][\mathrm{H}]} \\
& K_{1^{\prime}}=\frac{[\mathrm{H}]}{\left[1+\frac{[\mathrm{H}]^{2}}{K_{\mathrm{a} 1}}+\frac{K_{\mathrm{a} 1} K_{\mathrm{a} 2}}{}+K_{\mathrm{NHL}}[\mathrm{~N}][\mathrm{H}]\right]}
\end{aligned}
$$

# THE TWENTY-FIRST <br> INTERNATIONAL CHEMISTRY OLYMPIAD 2-10 JULY 1989, HALLE, GERMAN DEMOCRATIC REPUBLIC 

## THEORETICAL PROBLEMS

## PROBLEM 1

To determine the solubility product of copper(II) iodate, $\mathrm{Cu}\left(\mathrm{IO}_{3}\right)_{2}$, by iodometric titration in an acidic solution $\left(25^{\circ}\right.$ C) $30.00 \mathrm{~cm}^{3}$ of a 0.100 molar sodium thiosulphate solution are needed to titrate $20.00 \mathrm{~cm}^{3}$ of a saturated aqueous solution $\mathrm{Cu}\left(\mathrm{IO}_{3}\right)_{2}$.
1.1 Write the sequence of balanced equations for the above described reactions.
1.2 Calculate the initial concentration of $\mathrm{Cu}^{2+}$ and the solubility product of copper(II) iodate. Activity coefficients can be neglected.

## SOLUTION

$1.12 \mathrm{Cu}^{2+}+4 \mathrm{IO}_{3}^{-}+24 \mathrm{I}^{-}+24 \mathrm{H}^{+} \rightarrow 2 \mathrm{CuI}+13 \mathrm{I}_{2}+12 \mathrm{H}_{2} \mathrm{O}$

$$
\begin{equation*}
\mathrm{I}_{2}+2 \mathrm{~S}_{2} \mathrm{O}_{3}^{2-} \rightarrow 2 \mathrm{I}^{-}+\mathrm{S}_{4} \mathrm{O}_{6}^{2-} \tag{1}
\end{equation*}
$$

1.2 From (2):
$n\left(\mathrm{~S}_{2} \mathrm{O}_{3}^{2-}\right)=c V=0,100 \mathrm{~mol} \mathrm{dm}^{-3} \times 0,03000 \mathrm{dm}^{3}=3.00 \times 10^{-3} \mathrm{~mol}$
From (2) and (1):
$n\left(l_{2}\right)=1.50 \times 10^{-3} \mathrm{~mol}$
$n\left(\mathrm{Cu}^{2+}\right)=\frac{1.50 \times 10^{-3} \mathrm{~mol}}{13} \times 2=2.31 \times 10^{-4} \mathrm{~mol}$
$c\left(\mathrm{Cu}^{2+}\right)=\frac{2.31 \times 10^{-4} \mathrm{~mol}}{0.02000 \mathrm{dm}^{3}}=1.15 \times 10^{-2} \mathrm{~mol}$
$\left[\mathrm{Cu}^{2+}\right]=1.15 \times 10^{-2}$

$$
\begin{aligned}
& {\left[\mathrm{IO}_{3}^{-}\right]=2\left[\mathrm{Cu}^{2+}\right]} \\
& K_{s p}=\left[\mathrm{Cu}^{2+}\right]\left[\mathrm{IO}_{3}^{-}\right]^{2}=4\left[\mathrm{Cu}^{2+}\right]^{3}=4 \times\left(1.15 \times 10^{-2}\right)^{3}=6.08 \times 10^{-6}
\end{aligned}
$$

## PROBLEM 3

Sulphur dioxide is removed from waste gases of coal power stations by washing with aqueous suspensions of calcium carbonate or calcium hydroxide. The residue formed is recovered.
3.1 Write all reactions as balanced equations.
3.2 How many kilograms of calcium carbonate are daily consumed to remove $95 \%$ of the sulphur dioxide if $10000 \mathrm{~m}^{3} / \mathrm{h}$ of waste gas (corrected to $0^{\circ} \mathrm{C}$ and standard pressure) containing 0.15 \% sulphur dioxide by volume are processed? How many kilograms of gypsum are recovered thereby?
3.3 Assuming that the sulphur dioxide is not being removed and equally spread in an atmospheric liquid water pool of $5000 \mathrm{~m}^{3}$ and fully returned on earth as rain, what is the expected pH of the condensed water?
3.4 If a sodium sulphite solution is used for absorption, sulphur dioxide and the sulphite solution can be recovered. Write down the balanced equations and point out possible pathways to increase the recovery of sulphur dioxide from an aqueous solution.

Note:
Protolysis of sulphur dioxide in aqueous solutions can be described by the first step dissociation of sulphurous acid. The dissociation constant $K_{a, 1}\left(\mathrm{H}_{2} \mathrm{SO}_{3}\right)=10^{-2.25}$.
Assume ideal gases and a constant temperature of $0^{\circ} \mathrm{C}$ at standard pressure.
$M\left(\mathrm{CaCO}_{3}\right)=100 \mathrm{~g} \mathrm{~mol}^{-1} ; M\left(\mathrm{CaSO}_{4}\right)=172 \mathrm{~g} \mathrm{~mol}^{-1}$.

## SOLUTION

```
\(3.1 \mathrm{SO}_{2}+\mathrm{CaCO}_{3}+1 / 2 \mathrm{O}_{2}+2 \mathrm{H}_{2} \mathrm{O} \rightarrow \mathrm{CaSO}_{4} .2 \mathrm{H}_{2} \mathrm{O}+\mathrm{CO}_{2}\) \(\mathrm{SO}_{2}+\mathrm{Ca}(\mathrm{OH})_{2}+1 / 2 \mathrm{O}_{2}+\mathrm{H}_{2} \mathrm{O} \rightarrow \mathrm{CaSO}_{4} .2 \mathrm{H}_{2} \mathrm{O}\)
```

3.2 Under given conditions:
$n\left(\mathrm{SO}_{2}\right) / \mathrm{h}=v\left(\mathrm{SO}_{2} / \mathrm{h}\right) / V=669.34 \mathrm{~mol} \mathrm{~h}^{-1}$
$m\left(\mathrm{CaCO}_{3} / \mathrm{d}\right)=n\left(\mathrm{SO}_{2} / \mathrm{h}\right) \times M\left(\mathrm{CaCO}_{3}\right) \times 24 \mathrm{~h} \cdot \mathrm{~d}^{-1} \times 0.95=1.53 \times 10^{3} \mathrm{~kg} / \mathrm{d}$
$m\left(\mathrm{CaSO}_{4} \cdot 2 \mathrm{H}_{2} \mathrm{O}\right)=\frac{M\left(\mathrm{CaSO}_{4} \cdot 2 \mathrm{H}_{2} \mathrm{O}\right)}{M\left(\mathrm{CaCO}_{3}\right)} \times m\left(\mathrm{CaCO}_{3}\right) / \mathrm{d}=2.63 \times 10^{3} \mathrm{~kg} / \mathrm{d}$
$3.3 \mathrm{pH}=-\log \left[\mathrm{H}_{3} \mathrm{O}^{+}\right] ; \quad \mathrm{K}_{\mathrm{a}}=\frac{\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]^{2}}{\left[\mathrm{SO}_{2}\right]-\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]}$
$\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]_{1 / 2}=-\frac{K_{a}}{2} \pm \sqrt{\frac{K_{a}^{2}}{4}+K_{A}\left[\mathrm{SO}_{2}\right]}$

Solving for $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]$:
If $\left[\mathrm{SO}_{2}\right]=n\left(\mathrm{SO}_{2}\right) / V=1.34 \times 10^{-4}$ and $K_{a}=1 \times 10^{-2.25}$, then $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=1.32 \times 10^{-4}$ and $p H=3.88$
$3.4 \mathrm{SO}_{2}+\mathrm{Na}_{2} \mathrm{SO}_{3}+\mathrm{H}_{2} \mathrm{O} \rightarrow 2 \mathrm{NaHSO}_{3}$
Possibilities to increase the recovery of $\mathrm{SO}_{2}$ are: temperature rise, reduced pressure, lower pH -value.

## PROBLEM 2

## IONIC SOLUTIONS - AQUEOUS SOLUTIONS OF COPPER SALTS

This part is about the acidity of the hydrated $\mathrm{Cu}^{2+}$ ion and the precipitation of the hydroxide.

Consider a $1.00 \times 10^{-2} \mathrm{~mol} \mathrm{dm}^{-3}$ solution of copper(II) nitrate. The pH of this solution is 4.65.
2.1 Give the equation for the formation of the conjugate base of the hydrated $\mathrm{Cu}^{2+}$ ion.
2.2 Calculate the $p K_{a}$ of the corresponding acid-base pair.

The solubility product of copper(II) hydroxide is $K_{s p}=1 \times 10^{-20}$.
2.3 At what $p H$ value hydroxide $\mathrm{Cu}(\mathrm{OH})_{2}$ precipitates from the solution under consideration? Justify your calculation showing that the conjugate base of this hydrated $\mathrm{Cu}^{2+}$ ion is present in negligible quantity.

## Disproportionation of copper(I) ions

The $\mathrm{Cu}^{+}$ion is involved in two redox couples:
Couple 1: $\mathrm{Cu}^{+}+\mathrm{e}^{-} \rightleftharpoons \mathrm{Cu}$
Standard electrode potential $E_{1}^{0}=+0.52 \mathrm{~V}$

Couple 2: $\mathrm{Cu}^{2+}+\mathrm{e}^{-} \rightleftharpoons \mathrm{Cu}^{+}$
Standard electrode potential $E_{2}^{0}=+0.16 \mathrm{~V}$
2.4 Write down the equation for the disproportionation of copper(I) ions and calculate the corresponding equilibrium constant.
2.5 Calculate the composition of the solution (in $\mathrm{mol} \mathrm{dm}^{-3}$ ) obtained on dissolving $1.00 \times 10^{-2} \mathrm{~mol}$ of copper(I) in $1.0 \mathrm{dm}^{3}$ of water.
2.6 Apart from $\mathrm{Cu}^{+}$ions, name two chemical species which also disproportionate in aqueous solution; write down the equations and describe the experimental conditions under which disproportionation is observed.

Consider the stability of copper $(\mathrm{I})$ oxide, $\mathrm{Cu}_{2} \mathrm{O}$, in contact with a $1.00 \times 10^{-2} \mathrm{~mol} \mathrm{dm}^{-3}$ solution of $\mathrm{Cu}^{2+}$ ions. The solubility product of copper $(\mathrm{I})$ oxide is $K_{s p}=\left[\mathrm{Cu}^{+}\right]\left[\mathrm{OH}^{-}\right]=1 \times 10^{-15}$
2.7 Calculate the pH value at which $\mathrm{Cu}_{2} \mathrm{O}$ becomes stable. Quote a simple experiment allowing the observation of the precipitation of $\mathrm{Cu}_{2} \mathrm{O}$.

## Complex formation involving $\mathrm{Cu}^{+}$and $\mathrm{Cu}^{2+}$ ions

2.8 The dissociation constant of the complex ion $\left[\mathrm{Cu}\left(\mathrm{NH}_{3}\right)_{2}\right]^{+}$is $K_{D}=1 \times 10^{-11}$. Calculate the standard electrode potential of the couple:
$\left[\mathrm{Cu}\left(\mathrm{NH}_{3}\right)_{2}\right]^{+}+\mathrm{e}^{-} \rightleftarrows \mathrm{Cu}+2 \mathrm{NH}_{3}$
2.9 The standard electrode potential of the couple
$\left[\mathrm{Cu}\left(\mathrm{NH}_{3}\right)_{4}\right]^{2+}+2 \mathrm{e}^{-} \rightleftarrows \mathrm{Cu}+4 \mathrm{NH}_{3}$
$E_{3}^{0}=-0,02 \mathrm{~V}$.
Calculate the dissociation constant for the complex ion $\left[\mathrm{Cu}\left(\mathrm{NH}_{3}\right)_{4}\right]^{2+}$.
2.10 Deduce from it the standard electrode potential of the couple:
$\left[\mathrm{Cu}\left(\mathrm{NH}_{3}\right)_{4}\right]^{2+}+\mathrm{e}^{-} \rightleftarrows\left[\mathrm{Cu}\left(\mathrm{NH}_{3}\right)_{2}\right]^{+}+2 \mathrm{NH}_{3}$
Does the disproportionation of the cation $\left[\mathrm{Cu}\left(\mathrm{NH}_{3}\right)_{2}\right]^{+}$take place?

## SOLUTION

$2.1\left[\mathrm{Cu}\left(\mathrm{H}_{2} \mathrm{O}\right)_{4}\right]^{2+}+\mathrm{H}_{2} \mathrm{O} \rightarrow \mathrm{H}_{3} \mathrm{O}^{+}+\left[\mathrm{Cu}(\mathrm{OH})\left(\mathrm{H}_{2} \mathrm{O}\right)_{3}\right]^{+}$
$2.2 K_{a}=\frac{\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]\left[\left[\mathrm{Cu}(\mathrm{OH})\left(\mathrm{H}_{2} \mathrm{O}\right)_{3}\right]^{+}\right]}{\left[\left[\mathrm{Cu}\left(\mathrm{H}_{2} \mathrm{O}\right)_{4}\right]^{2+}\right]}=\frac{\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]^{2}}{\left[\left[\mathrm{Cu}\left(\mathrm{H}_{2} \mathrm{O}\right)_{4}\right]^{2+}\right]}=\frac{\left(2.24 \times 10^{-5}\right)^{2}}{1 \times 10^{-2}}=5.01 \times 10^{-8}$
$p K_{a}=7.30$
$2.3\left[\mathrm{Cu}^{2+}\right]\left[\mathrm{OH}^{-}\right]^{2}=1 \times 10^{-20} ;\left[\mathrm{Cu}^{2+}\right]=1 \times 10^{-2} \Rightarrow\left[\mathrm{OH}^{-}\right]=1 \times 10^{-9} ; \mathrm{pH}=5$
$\left[\left[\mathrm{Cu}(\mathrm{OH})\left(\mathrm{H}_{2} \mathrm{O}\right)_{3}\right]^{+}\right]:\left[\left[\mathrm{Cu}\left(\mathrm{H}_{2} \mathrm{O}\right)_{4}\right]^{2+}\right]=K_{a}: 10^{-\mathrm{pH}}=1 \times 10^{-7.3}: 1 \times 10^{-5}=1: 200$
$2.42 \mathrm{Cu}^{+} \rightarrow \mathrm{Cu}^{2+}+\mathrm{Cu}$
$K=\frac{\left[\mathrm{Cu}^{2+}\right]}{\left[\mathrm{Cu}^{+}\right]^{2}}$
$0.52-0.16=0.059 \log K($ Nernst equation $) \Rightarrow K=1 \times 10^{6}$
2.5 At equilibrium: $\left[\mathrm{Cu}^{+}\right]+2\left[\mathrm{Cu}^{2+}\right]=1 \times 10^{-2}$ and $\left[\mathrm{Cu}^{2+}\right]=1 \times 10^{6}\left[\mathrm{Cu}^{+}\right]$so that the following equation is obtained:
$2 \times 10^{6}\left[\mathrm{Cu}^{+}\right]^{2}+\left[\mathrm{Cu}^{+}\right]-1 \times 10^{-2}=0$
with the solution
$\left[\mathrm{Cu}^{+}\right]=\underline{7.07 \times 10^{-5}}$ and $\left[\mathrm{Cu}^{2+}\right]=\underline{4.96 \times 10^{-3}}$.
2.6 Other disproportionation reactions:
$2 \mathrm{H}_{2} \mathrm{O}_{2} \rightarrow 2 \mathrm{H}_{2} \mathrm{O}+\mathrm{O}_{2}$ (catalyzed by $\mathrm{KMnO}_{4}, \mathrm{Fe}^{3+}$ etc.)
$\mathrm{Cl}_{2}+\mathrm{OH}^{-} \rightarrow \mathrm{HCl}+\mathrm{ClO}^{-}$(basic conditions)
2.7 $\mathrm{Cu}_{2} \mathrm{O}+2 \mathrm{H}_{3} \mathrm{O}^{+}+2 \mathrm{e}^{-} \rightarrow 2 \mathrm{Cu}+3 \mathrm{H}_{2} \mathrm{O}$ $\left[\mathrm{Cu}^{+}\right]=\frac{1 \cdot 10^{-15}}{\left[\mathrm{OH}^{-}\right]}$
$E_{1}=0.52+\frac{0.059}{2} \log \left(\left[\mathrm{Cu}^{+}\right]\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]^{2}\right)=0.49-0.0885 \mathrm{pH}$
$2 \mathrm{Cu}^{2+}+3 \mathrm{H}_{2} \mathrm{O}+2 \mathrm{e}^{-} \rightarrow \mathrm{Cu}_{2} \mathrm{O}+2 \mathrm{H}_{3} \mathrm{O}^{+}$
$E_{2}=0.16+\frac{0.059}{2} \log \frac{1 \times 10^{-4}}{\left[\mathrm{Cu}^{+}\right]\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]^{2}}=0.07+0.0885 \mathrm{pH}$
$\mathrm{Cu}_{2} \mathrm{O}$ is stable when $E_{2}>E_{1}$ i.e. $0.42<0.177 \mathrm{pH}$, or $\mathrm{pH}>2.4$
$\mathrm{Cu}_{2} \mathrm{O}$ can be obtained by the reduction of $\mathrm{Cu}^{2+}$ in acid or basic media, e.g. by Fehling's solution or reducing sugars.
$2.8\left[\mathrm{Cu}\left(\mathrm{NH}_{3}\right)_{2}\right]^{+} \rightleftharpoons \mathrm{Cu}^{+}+2 \mathrm{NH}_{3}$
$K_{D}=\frac{\left[\mathrm{Cu}^{+}\right]\left[\mathrm{NH}_{3}\right]^{2}}{\left[\left[\mathrm{Cu}\left(\mathrm{NH}_{3}\right)_{2}{ }^{+}\right]\right]}=1 \times 10^{-11}$
Knowing $E_{0}\left(\mathrm{Cu}^{+} / \mathrm{Cu}\right)=0.52 \mathrm{~V}$, the $E^{0}\left(\left[\mathrm{Cu}\left(\mathrm{NH}_{3}\right)_{2}\right]^{+} / \mathrm{Cu}^{+}\right)$becomes:
$E_{\mathrm{f} 1}=0.52-0.06 p K_{D}=-\underline{0.14 \mathrm{~V}}$
2.9 The standard emf of a $\mathrm{Cu}^{2+} / \mathrm{Cu}$ cell is thus: $E^{0}=(0.5+0.16) / 2=0.33 \mathrm{~V}$ and $E_{3}{ }^{0}=0.33-0.03 p K_{2}$.

Thereout: $p K_{2}=\left(0.33-E_{3}{ }^{0}\right) / 0.03=(0.33-(-0.02)) / 0.03=\underline{12}$
$\left[\mathrm{Cu}\left(\mathrm{NH}_{3}\right)_{4}\right]^{2+}+2 \mathrm{e}^{-} \rightarrow \mathrm{Cu}+4 \mathrm{NH}_{3} \quad E_{0}=-0.02 \mathrm{~V}$
$\left[\mathrm{Cu}\left(\mathrm{NH}_{3}\right)_{2}\right]^{+}+\mathrm{e}^{-} \rightarrow \mathrm{Cu}+2 \mathrm{NH}_{3} \quad E_{0}=-0.14 \mathrm{~V}$
$\left[\mathrm{Cu}\left(\mathrm{NH}_{3}\right)_{4}\right]^{2+}+\mathrm{e}^{-} \rightarrow\left[\mathrm{Cu}\left(\mathrm{NH}_{3}\right)_{2}\right]^{+}+2 \mathrm{NH}_{3}$

Since only $\Delta G^{0}$ is additive and from $\Delta G^{0}=-n F E^{0}$ it follows:
$E_{\mathrm{f} 2}=2 \times(-0.02)-(-0.14)=0.10 \mathrm{~V}$
$2.10\left[\mathrm{Cu}\left(\mathrm{NH}_{3}\right)_{2}\right]^{+}+\mathrm{e}^{-} \rightarrow \mathrm{Cu}+2 \mathrm{NH}_{3}$ $E_{\mathrm{f} 1}=-0.14 \mathrm{~V}$
$\left[\mathrm{Cu}\left(\mathrm{NH}_{3}\right)_{4}\right]^{2+}+\mathrm{e}^{-} \rightarrow\left[\mathrm{Cu}\left(\mathrm{NH}_{3}\right)_{2}\right]^{+}+2 \mathrm{NH}_{3}$ $E_{\mathrm{f} 2}=0.10 \mathrm{~V}$

Since $E_{\mathrm{f} 1}<E_{\mathrm{f} 2}$ the $\left[\mathrm{Cu}\left(\mathrm{NH}_{3}\right)_{2}\right]^{+}$ion doesn't disproportionate (the emf would be $-0.14-0.10=-0.24 \mathrm{~V}$ )

# THE TWENTY-THIRD <br> INTERNATIONAL CHEMISTRY OLYMPIAD <br> 7-15 JULY 1991, LODZ, POLAND 

## THEORETICAL PROBLEMS

## PROBLEM 1

1.1 Show that 0.1 mol of $\mathrm{Tl}_{2} \mathrm{~S}$ dissolves in a 1 M solution of any strong monoprotic noncoordinating acid.
1.2 Show that 0.1 CuS dissolves in a $1 \mathrm{M} \mathrm{HNO}_{3}$ but not in a 1 M HCl solution.

Information:
Assume that $\mathrm{Cu}^{2+}$ ions do not form stable complexes with chloride ions in aqueous solutions.
$E^{0}\left(\mathrm{~S} / \mathrm{S}^{2-}\right)=-0.48 \mathrm{~V} \quad E^{0}\left(\mathrm{NO}_{3}^{-} / \mathrm{NO}_{(\mathrm{aq})}\right)=0.96 \mathrm{~V}$
$p K_{a}\left(\mathrm{H}_{2} \mathrm{~S}\right)=7 \quad p K_{a}\left(\mathrm{HS}^{-}\right)=13$
$K_{s p}\left(\mathrm{TI}_{2} \mathrm{~S}\right)=1 \times 10^{-20} \quad K_{s p}(\mathrm{CuS})=1 \times 10^{-35}$
Solubility of NO in water ( 298 K ): $2.53 \times 10^{-2} \mathrm{~mol} \mathrm{dm}^{-3}$
Solubility of $\mathrm{H}_{2} \mathrm{~S}$ in water $(298 \mathrm{~K}): 0.1 \mathrm{~mol} \mathrm{dm}^{-3}$
$R=8.314 \mathrm{~J} \mathrm{~K}^{-1} \mathrm{~mol}^{-1} \quad F=96487 \mathrm{C} \mathrm{mol}^{-1}$

## SOLUTION

1.1 Solubility condition: $\left[\mathrm{TI}^{+}\right]^{2}\left[\mathrm{~S}^{2-}\right] \leq 1 \times 10^{-20}$
$\left[\mathrm{TI}^{+}\right]=c\left(\mathrm{TI}^{+}\right)=0.2 \mathrm{~mol} \mathrm{dm}^{-3}$
$c\left(\mathrm{~S}^{2-}\right)=\left[\mathrm{S}^{2-}\right]+\left[\mathrm{HS}^{-}\right]+\left[\mathrm{H}_{2} \mathrm{~S}\right]=\left[\mathrm{S}^{2-}\right]\left(1+\frac{\left[\mathrm{H}^{+}\right]}{K_{2}}+\frac{\left[\mathrm{H}^{+}\right]^{2}}{K_{1} K_{2}}\right)=0.1 \mathrm{~mol} \mathrm{dm}^{-3}$
$\left[\mathrm{S}^{2 \cdot}\right]=\frac{0.1}{1+\frac{\left[\mathrm{H}^{+}\right]}{K_{2}}+\frac{\left[\mathrm{H}^{+}\right]^{2}}{K_{1} K_{2}}} \Rightarrow$
For a strong monoprotic acid $\left(1 \mathrm{~mol} \mathrm{dm}^{-3}\right)$ and $\left[\mathrm{H}^{+}\right] \approx 1$.
Then
$1+10^{13}\left[\mathrm{H}^{+}\right] \ll 10^{20}\left[\mathrm{H}^{+}\right]^{2} \quad$ and $\quad\left[\mathrm{S}^{2}\right] \approx \frac{0.1}{1 \times 10^{20}}$
$\left[\mathrm{TI}^{+}\right]^{2}\left[\mathrm{~S}^{2}\right]=\frac{(0.2)^{2} \times 0.1}{1 \times 10^{20}}=4 \times 10^{-23}<K_{s}\left(\mathrm{TI}_{2} \mathrm{~S}\right)$
Thus, 0.1 mol of $\mathrm{Tl}_{2} \mathrm{~S}$ dissolves in a 1 M solution of any strong monoprotic noncoordinating acid.

## 1.2

- Dissolving CuS in 1 M solution HCl (non-oxidizing and non-complexing acid):
$\mathrm{c}\left(\mathrm{Cu}^{2+}\right)=0.1 \mathrm{~mol} \mathrm{dm}^{-3}$
$\left[\mathrm{Cu}^{2+}\right]=0.1$
$c\left(\mathrm{~S}^{2}\right)=0.1 \mathrm{~mol} \mathrm{dm}^{-3}$
Similarly as in part (1.1):
$\left[\mathrm{S}^{2}\right]=\frac{0.1}{1+\frac{\left[\mathrm{H}^{+}\right]}{K_{2}}+\frac{\left[\mathrm{H}^{+}\right]^{2}}{K_{1} K_{2}}}$
$\left[S^{2}\right] \approx \frac{0.1}{1 \times 10^{20}}$
$\left[\mathrm{Cu}^{2+}\right]\left[\mathrm{S}^{2}\right]=\frac{(0.1)^{2} \times 0.1}{1 \times 10^{20}} \approx 1 \times 10^{-23}>K_{s}(\mathrm{CuS})$
Conclusion: 0.1 mol CuS does not dissolve in 1 M solution HCl .
- When dissolving 0.1 mol CuS in $1 \mathrm{M} \mathrm{HNO}_{3}$ an additional redox process occurs: the oxidation of $\mathrm{S}^{2-}$ to S .

$$
2 \mathrm{NO}_{3}^{-}+8 \mathrm{H}^{+}+3 \mathrm{~S}^{2-} \rightarrow 3 \mathrm{~S}+2 \mathrm{NO}+4 \mathrm{H}_{2} \mathrm{O}
$$

The emf of this reaction is $\Delta E=E_{1}^{0}-E_{2}^{0}=(0.96+0.48)=\underline{1.44 \mathrm{~V}}$

$$
\log K=\frac{\Delta G}{R T}=\frac{n F}{R T} \Delta E=\frac{n_{1} n_{2}\left(E_{1}^{o}-E_{2}^{o}\right)}{0.0591} \cong 144 \quad K=1 \times 10^{144}
$$

The equilibrium constant of this process can also be written in the form:
$K=\frac{\left[\mathrm{NO}^{2}\right.}{\left[\mathrm{NO}_{3}^{-}\right]^{2}\left[\mathrm{H}^{+}\right]^{8}\left[\mathrm{~S}^{2}\right]^{3}}$
From the above equilibrium follows that $\left[\mathrm{S}^{2-}\right]=\sqrt[3]{\frac{K\left[\mathrm{NO}_{3}^{-}\right]^{2}\left[\mathrm{H}^{+}\right]^{8}}{[\mathrm{NO}]^{2}}}$
Since $\left[\mathrm{NO}_{3}^{-}\right]=\left[\mathrm{H}^{+}\right]=1$
$\left[\mathrm{S}^{2-}\right]=\sqrt[3]{\frac{K}{[\mathrm{NO}]^{2}}}$
$c_{\text {Cus }}=[\mathrm{S}]+\left[\mathrm{H}_{2} \mathrm{~S}\right]+[\mathrm{HS}]+\left[\mathrm{S}^{2}\right]$
$\left[\mathrm{S}^{2-}\right]=\frac{c_{\text {cus }}}{1+\frac{\left[\mathrm{H}^{+}\right]}{K_{1}}+\frac{\left[\mathrm{H}^{+}\right]^{2}}{K_{1} K_{2}}+\sqrt[3]{\frac{K}{[\mathrm{NO}]^{2}}}}$
However
$1+\frac{\left[\mathrm{H}^{+}\right]}{K_{1}}+\frac{\left[\mathrm{H}^{+}\right]^{2}}{K_{1} K_{2}} \ll \sqrt[3]{\frac{K}{[\mathrm{NO}]^{2}}}=\sqrt[3]{\frac{1 \times 10^{144}}{(0.0253)^{2}}}=1.16 \times 10^{49}$
$\left[S^{2-}\right]=\frac{0.1}{1.16 \times 10^{49}}=8.62 \times 10^{-51}$
$\left[\mathrm{Cu}^{2+}\right]\left[\mathrm{S}^{2-}\right]=0.1 \times 8.62 \times 10^{-51}=8.62 \times 10^{-52} \ll K_{s p}(\mathrm{CuS})\left(=1 \times 10^{-35}\right)$
Conclusion: CuS dissolves in 1 M solution of $\mathrm{HNO}_{3}$.

## PROBLEM 3

Type II electrodes that are made of a metal covered with a sparingly soluble salt of the metal are dipped into a soluble salt solution containing an anion of the sparingly soluble salt. The silver/silver chloride ( $\mathrm{Ag}, \mathrm{AgCl}^{-1}$ ) and the calomel electrode ( Hg , $\mathrm{Hg}_{2} \mathrm{Cl}_{2} / \mathrm{Cl}^{-}$) are examples of such electrodes. The standard emf of a cell built of those electrodes (-) $\mathrm{Ag}, \mathrm{AgCl} / \mathrm{Cl}^{-} \| \mathrm{Hg}_{2} \mathrm{Cl}_{2} / \mathrm{Hg}(+)$ is $E^{0}=0.0455 \mathrm{~V}$ at $T=298 \mathrm{~K}$. The temperature coefficient for this cell is $d E^{0} / d T=3.38 \times 10^{-4} \mathrm{~V} \mathrm{~K}^{-1}$.
3.1 Give the equations of the reactions taking place at both the cell electrodes and the overall cell reaction.
3.2 Calculate the Gibbs free energy change $\left(\Delta G^{0}\right)$ for the process taking place in the cell at 298 K . What does its sign imply?
3.3 Calculate the enthalpy change for the process taking place at 298 K . $\Delta S=n F \Delta E / \Delta T$.
3.4 Knowing the standard potential of $\mathrm{Ag} / \mathrm{Ag}^{+}$electrode is $E^{0}=0.799 \mathrm{~V}$ and the solubility product of $\mathrm{AgCl} K_{s p}=1.73 \times 10^{-10}$, calculate the standard electrode potential value of the silver/silver chloride electrode. Derive an expression showing the dependence between $E^{0}\left(\mathrm{Ag} / \mathrm{Ag}^{+}\right)$and $E^{0}\left(\mathrm{Ag}, \mathrm{AgCl} / \mathrm{Cl}^{-}\right)$.
3.5 Calculate the solubility product of $\mathrm{Hg}_{2} \mathrm{Cl}_{2}$ knowing that the standard potential of the calomel electrode is $E^{0}=0.798 \mathrm{~V}$.
$F=96487 \mathrm{C} \mathrm{mol}^{-1}, \quad R=8.314 \mathrm{~J} \mathrm{~mol}^{-1} \mathrm{~K}^{-1}, \quad T=298 \mathrm{~K}$

## SOLUTION

$\begin{array}{lrl}\text { 3.1 } & \text { Reduction (calomel electrode (+)): } & 1 / 2 \mathrm{Hg}_{2} \mathrm{Cl}_{2}+\mathrm{e}^{-} \rightarrow \mathrm{Hg}+\mathrm{Cl}^{-} \\ \text {Oxidation (silver/silver chloride electrode (-)) } & \mathrm{Ag}+\mathrm{Cl}^{-} \rightarrow \mathrm{AgCl}+\mathrm{e}^{-} \\ & \text {Summary reaction: } & \mathrm{Ag}+1 / 2 \mathrm{Hg}_{2} \mathrm{Cl}_{2} \rightarrow \mathrm{Hg}+\mathrm{AgCl}\end{array}$
$3.2 \Delta G^{0}=-n F E^{0}=-96497 \mathrm{C} \mathrm{mol}^{-1} \times 0.0455 \mathrm{~V}=-4.39 \mathrm{~kJ} \mathrm{~mol}^{-1}$; Since $\Delta G^{0}$ is negative, the reaction is spontaneous.
3.3 The change of enthalpy is related to the Gibbs-Helmholtz equation:

$$
\begin{aligned}
\Delta H & =\Delta G+T \Delta S=-n F E+T n F\left(\frac{\Delta E^{0}}{\Delta t}\right)=-n F\left(E-T\left(\frac{\Delta E^{0}}{\Delta t}\right)\right)= \\
& =-96487 \mathrm{C} \mathrm{~mol}^{-1}\left(0.0455 \mathrm{~V}-298 \mathrm{~K} \times 3.38 \times 10^{-4} \mathrm{~V} \mathrm{~K}^{-1}\right)=5.36 \mathrm{~kJ} \mathrm{~mol}^{-1}
\end{aligned}
$$

3.4 For the $\mathrm{Ag} \mid \mathrm{Ag}^{+}$electrode: $E=E^{0}+0.0591 \log \left[\mathrm{Ag}^{+}\right]$

For the $\mathrm{Ag}, \mathrm{AgCl} \mid \mathrm{Cl}^{-}$electrode $\left[\mathrm{Ag}^{+}\right]$is determined by the solubility product:

$$
\begin{aligned}
& {\left[\mathrm{Ag}^{+}\right]=\frac{K_{s p}}{\left[\mathrm{Cl}^{-}\right]}} \\
& \quad E^{O}\left(\mathrm{Ag}, \mathrm{AgCl} \mid \mathrm{Cl}^{-}\right)=E^{\circ}\left(\mathrm{Ag} \mid \mathrm{Ag}^{+}\right)+0.0591 \log K_{s p}=0.799-0.577=0.222 \mathrm{~V}
\end{aligned}
$$

$3.5 E^{0}\left(\mathrm{Hg}, \mathrm{Hg}_{2} \mathrm{Cl}_{2} \mid \mathrm{Cl}^{-}\right)=E^{0}\left(\mathrm{Hg} \mid \mathrm{Hg}^{2+}\right)+\frac{0.0591}{2} \log K_{s p}\left(\mathrm{Hg}_{2} \mathrm{Cl}_{2}\right)$
The standard potential of the calomel electrode is equal to $0.0455+0.222=$ $=0.2675 \mathrm{~V}$.

Thus, $\log K_{\text {sp }}\left(\mathrm{Hg}_{2} \mathrm{Cl}_{2}\right)$ can be calculated as:

$$
\begin{aligned}
& \log K_{s p}\left(\mathrm{Hg}_{2} \mathrm{Cl}_{2}\right)=\frac{2(0.2675-0.798)}{0.0591}=-17.99 \\
& K_{s p}=1.03 \times 10^{-18}
\end{aligned}
$$

## PROBLEM 7

When the fresh-water rivers that run into the Chesapeake Bay flood after heavy rains in the spring, the increase in fresh water in the Bay causes a decrease in the salinity in the areas where oysters grow. The minimum concentration of chloride ions needed in oyster beds for normal growth is $8 \mathrm{ppm}\left(8 \mathrm{mg} \mathrm{dm}^{-3}\right)$.

After one week of heavy rain, the following analysis is done on water from the bay. To a $50.00 \mathrm{~cm}^{3}$ sample of bay water a few drops of a $\mathrm{K}_{2} \mathrm{CrO}_{4}$ solution are added. The sample is then titrated with $16.16 \mathrm{~cm}^{3}$ of a $0.00164 \mathrm{M} \mathrm{AgNO}_{3}$ solution. After $\mathrm{AgNO}_{3}$ solution has been added to the sample a bright red-orange precipitate forms.
7.1 What is the molar concentration of chloride in the sample?
7.2 Does the water contain sufficient chloride for the normal growth of oysters? Show your calculation.
7.3 Write a balanced equation for the reaction of the analyte with the titrant.
7.4 Write a balanced net-ionic equation that describes the reaction responsible for the colour change at the endpoint of the titration. Which compound produces the brickred colour?
7.5 The concentration of chromate at the endpoint is 0.020 M . Calculate the concentration of chloride ions in the solution when the red precipitate forms.
7.6 For this titration to work most effectively, the solution being titrated must be neutral or slightly basic. Write a balanced equation for the competing reaction that would occur in acidic medium that would influence the observed endpoint of this titration.

Typically, a buffer is added to the solution being titrated to control the pH if the initial sample is acidic. Suppose the pH of the sample of bay water was 5.10 , thus too acidic to perform the analysis accurately.
7.7 Select a buffer from the list that would enable you to establish and maintain a pH of 7.20 in aqueous medium. Show the calculations which lead to your choice.

## Buffer systems

1. $\quad 0.10 \mathrm{M}$ lactic acid / 0.10 M sodium lactate
2. 0.10 M acetic acid / 0.10 M sodium acetate
$\mathrm{K}_{\mathrm{a}}$ of weak acid
$1.4 \times 10^{-4}$
$1.8 \times 10^{-5}$
3. $\quad 0.10 \mathrm{M}$ sodium dihydrogen phosphate /
/ 0.10 M sodium hydrogen phosphate
$6.2 \times 10^{-8}$
4. $\quad 0.10 \mathrm{M}$ ammonium chloride $/ 0.10 \mathrm{M}$ ammonia
$5.6 \times 10^{-10}$
7.8 Using the selected buffer system, calculate the mass (in g) of weak acid and of conjugated base you would need to dissolve in distilled water to prepare $500 \mathrm{~cm}^{3}$ of a stock solution buffered at a pH of 7.2.
7.9 The chloride concentration in another $50.00 \mathrm{~cm}^{3}$ sample of bay water was determined by the Volhard method. In this method an excess of $\mathrm{AgNO}_{3}$ is added to the sample. The excess $\mathrm{Ag}^{+}$is titrated with standardized KSCN, forming a precipitate of AgSCN . The endpoint is signalled by the formation of the reddish-brown $\mathrm{FeSCN}^{2+}$ complex that forms when $\mathrm{Ag}^{+}$is depleted. If the excess $\mathrm{Ag}^{+}$from the addition of $50.00 \mathrm{~cm}^{3}$ of $0.00129 \mathrm{M} \mathrm{AgNO}_{3}$ to the water sample required $27.46 \mathrm{~cm}^{3}$ of $1.4110^{-3}$ M KSCN for titration, calculate the concentration of chloride in the bay water sample.

In natural waters with much higher concentration of $\mathrm{Cl}^{-}$, the $\mathrm{Cl}^{-}$can be determined gravimetrically by precipitating the $\mathrm{Cl}^{-}$as AgCl . A complicating feature of this method is the fact that AgCl is susceptible to photodecomposition as shown by the reaction:

$$
\mathrm{AgCl}(\mathrm{~s}) \rightarrow \mathrm{Ag}(\mathrm{~s})+1 / 2 \mathrm{Cl}_{2}(\mathrm{~g})
$$

Furthermore, if this photodecomposition occurs in the presence of excess $\mathrm{Ag}^{+}$, the following additional reaction occurs:

$$
3 \mathrm{Cl}_{2}(\mathrm{~g})+3 \mathrm{H}_{2} \mathrm{O}+5 \mathrm{Ag}^{+} \rightarrow 5 \mathrm{AgCl}+\mathrm{ClO}_{3}^{-}+6 \mathrm{H}^{+}
$$

If 0.010 g of a 3.000 g sample of AgCl contaminated with excess $\mathrm{Ag}^{+}$undergoes photodecomposition by the above equations
7.10 Will the apparent weight of AgCl be too high or too low? Explain your answer showing by how many grams the two values will differ.

Data: $\quad K_{\text {sp }}(\mathrm{AgCl})=1.78 \times 10^{-10}$

$$
K_{s p}\left(\mathrm{Ag}_{2} \mathrm{CrO}_{4}\right)=1.00 \times 10^{-12}
$$

## SOLUTION

$7.1 n\left(\mathrm{Ag}^{+}\right)=n\left(\mathrm{Cl}^{-}\right)$
$c\left(\mathrm{Cl}^{-}\right)=\frac{0.01616 \mathrm{dm}^{3} \times 0.00164 \mathrm{~mol} \mathrm{dm}^{-3}}{0.050 \mathrm{dm}^{3}}=5.30 \times 10^{-4} \mathrm{~mol} \mathrm{dm}^{-3}$
7.2 Concentration in $\mathrm{mg} \mathrm{dm}^{-3}=5.30 \times 10^{-4} \mathrm{~mol} \mathrm{dm}^{-3} \times 35.5 \mathrm{~g} \mathrm{~mol}^{-1}=0.0188 \mathrm{~g} \mathrm{dm}^{-3}=$ $=18.8 \mathrm{mg} \mathrm{dm}^{-3}$

Thus the chloride concentration is sufficiently high for normal oyster growth.
7.3 $\mathrm{Ag}^{+}(\mathrm{aq})+\mathrm{Cl}^{-}(\mathrm{aq}) \rightarrow \mathrm{AgCl} \downarrow(\mathrm{s})$
$7.42 \mathrm{Ag}^{+}(\mathrm{aq})+\mathrm{CrO}_{4}{ }^{2-}(\mathrm{aq}) \rightarrow \mathrm{Ag}_{2} \mathrm{CrO}_{4} \downarrow$ (s) (brick-red colour)
7.5 $K_{s p}\left(\mathrm{Ag}_{2} \mathrm{CrO}_{4}\right)=\left[\mathrm{Ag}^{+}\right]^{2}\left[\mathrm{CrO}_{4}{ }^{2-}\right]=4 \mathrm{x}^{3}$ if $\mathrm{x}=\left[\mathrm{Ag}^{+}\right] \Rightarrow$
$\left[\mathrm{Ag}^{+}\right]=7.07 \times 10^{-6} ; \quad\left[\mathrm{CrO}_{4}{ }^{2-}\right]=2 \times 10^{-2}$
$\left[\mathrm{Cl}^{-}\right]=\frac{K_{s p}(\mathrm{AgCl})}{\left[\mathrm{Ag}^{+}\right]}=\frac{1.78 \times 10^{-10}}{7.07 \times 10^{-6}}=2.5 \times 10^{-5}$
$7.62 \mathrm{CrO}_{4}^{2-}+2 \mathrm{H}^{+} \rightarrow \mathrm{Cr}_{2} \mathrm{O}_{7}^{2-}+\mathrm{H}_{2} \mathrm{O}$
either/or
$\mathrm{CrO}_{4}^{2-}+\mathrm{H}^{+} \rightarrow \mathrm{HCrO}_{4}^{-}+\mathrm{H}_{2} \mathrm{O}$
7.7 A buffer system has its maximum buffer capacity when $p H=p K_{a}$. So, the system 3 would be best since $p K_{a}=7.2$
$7.8 m\left(\mathrm{NaH}_{2} \mathrm{PO}_{4}\right)=0.10 \mathrm{~mol} \mathrm{dm}^{-3} \times 0.500 \mathrm{dm}^{3} \times 119.98 \mathrm{~g} \mathrm{~mol}^{-1}=6.0 \mathrm{~g}$ $m\left(\mathrm{Na}_{2} \mathrm{HPO}_{4}\right)=0.10 \mathrm{~mol} \mathrm{dm}^{-3} \times 0.500 \mathrm{dm}^{3} \times 141.96 \mathrm{~g} \mathrm{~mol}^{-1}=7.1 \mathrm{~g}$
7.9 mol Ag ${ }^{+}$added: $n\left(\mathrm{Ag}^{+}\right)_{\mathrm{ad}}=0.05 \mathrm{dm}^{3} \times 0.00129 \mathrm{~mol} \mathrm{dm}^{-3}=6.45 \times 10^{-5} \mathrm{~mol}$ $\mathrm{mol} \mathrm{Ag}^{+}$left over: $n\left(\mathrm{Ag}^{+}\right)_{\text {left }}=0.02746 \mathrm{dm}^{3} \times 0.0141 \mathrm{~mol} \mathrm{dm}^{-3}=3.87 \times 10^{-5} \mathrm{~mol}$ mol Cl in sample:
$n\left(\mathrm{Cl}^{-}\right)=n\left(\mathrm{Ag}^{+}\right)_{\text {ad }}-n\left(\mathrm{Ag}^{+}\right)_{\text {left }}=\left(6.45 \times 10^{-5} \mathrm{~mol}\right)-\left(3.87 \times 10^{-5} \mathrm{~mol}\right)=2.58 \times 10^{-5} \mathrm{~mol}$
$\Rightarrow \quad[\mathrm{Cl}]=\frac{2.58 \times 10^{-5}}{0.050}=5.16 \times 10^{-4} \mathrm{~mol} \mathrm{dm}^{-3}$
$7.10 n(\mathrm{AgCl})$ lost: $\quad \frac{0.010 \mathrm{~g} \mathrm{AgCl}}{143.35 \mathrm{gmol}-1}=6.98 \times 10^{-5} \mathrm{~mol}$
$n\left(\mathrm{Cl}_{2}\right)$ produced: $\quad 1 / 2\left(6.98 \times 10^{-5} \mathrm{~mol}\right)=3.49 \times 10^{-5} \mathrm{~mol}$
$n(\mathrm{AgCl})$ new prod.: $\quad 5 / 3\left(3.49 \times 10^{-5} \mathrm{~mol}\right)=5.82 \times 10^{-5} \mathrm{~mol} \equiv 8.34 \mathrm{mg}$
The amount of Ag formed is equal to the amount of AgCl lost, thus
$[A g]_{\text {formed }}=6.98 \times 10^{-5} \mathrm{~mol} \times 107.9 \mathrm{~g} \mathrm{~mol}^{-1}=7.53 \times 10^{-3} \mathrm{~g}$
The mass of the sample is equal to $3.0 \mathrm{~g}-0.010 \mathrm{~g}+0.00834 \mathrm{~g}+0.00753 \mathrm{~g}=$ $=3.006 \mathrm{~g}$. Therefore the total mass of the solid $(\mathrm{AgCl}+\mathrm{Ag})$ will be too high and the difference is 6 mg .

## PROBLEM 2

The reflux of bile duodenal matter is suspected to be the major cause of gastritis and medical therapy is based on the treatment with antiacida that buffer the pH of gastric juices by binding bile acids and lysolecithin. Two bile acids, i. e. cholic acid (CA) and glycocholic acid (GCA), were chosen to study the properties of some antiacida commercial formulations. Separation and determination of the two acids in artificial and natural gastric juices were required and high performance liquid chromatography (HPLC) was used as analytical technique.

Two chromatographic columns (A and B, respectively) were selected on the base of published literature data and preliminary tests were carried out to choose the column (between A and B) which would yield the best separation of the aforementioned compounds. The retention times ( $t$ ) of the two acids, of a substance not retained by the chromatographic columns and of a compound used as internal standard (i.s.) are shown in the first two columns of the Table. Both chromatographic columns are 25 cm long and show the efficiency of $2.56 \times 10^{4}$ theoretical plates per meter $\left(\mathrm{N} \mathrm{m}^{-1}\right)$.

In actual analysis, an artificial gastric juice was extracted with an appropriate solvents mixture and then final solution $\left(1 \mathrm{~cm}^{3}\right)$ contained $100 \%$ of the two acids present in the original mixture. $100 \mu \mathrm{~cm}^{3}$ of the extract with $2.7 \mu$ moles of the internal standard were analysed by HPLC using the selected column. The response factors (F) of CA and GCA with respect to the i.s. and the chromatographic peak areas of the two compounds are reported in the Table.

|  | Column A <br> $t(\mathrm{~s})$ | Column B <br> $t(\mathrm{~s})$ | F | Area |
| :--- | :---: | :---: | :---: | :---: |
| Unretained <br> compound | 120 | 130 | - | - |
| Cholic Acid (CA) | 380 | 350 | 0.5 | 2200 |
| Glycocholic Acid <br> (GCA) | 399 | 395 | 0.2 | 3520 |
| Internal standard | 442 | 430 | - | 2304 |

In answering to the questions remember that:

$$
\begin{align*}
& R=\frac{\sqrt{N}}{4} \times \frac{\alpha-1}{\alpha} \frac{K^{\prime}}{K^{\prime}+1}  \tag{1}\\
& \alpha=\frac{t_{2}^{\prime}}{t_{1}^{\prime}}=\frac{t_{2}-t_{0}}{t_{1}-t_{0}}  \tag{2}\\
& K^{\prime}=K_{2}^{\prime}=\frac{t_{2}^{\prime}}{t_{0}}=\frac{t_{2}-t_{0}}{t_{0}} \tag{3}
\end{align*}
$$

## Questions:

2.1 Using $R, \alpha$ and $K^{\prime}$ values, demonstrate which of the two chromatographic columns would you use, considering that an accurate determination requires the best possible (baseline) separation of all compounds (do not take into account the unretained compound)?
2.2 Calculate the amounts of each acid in the extract solution.

## SOLUTION

Nowadays, chromatography is the most powerful technique for the separation and quantification of organic compounds from volatiles to high molecular weight substances. In conjunction with a mass-spectrometer, it can lead to the undoubted identification of compounds even in extremely complex mixtures. Liquid chromatography (HPLC) is becoming a routine analytical technique in a large variety of fields and in particular in biochemistry and in medicine where compounds are unsuitable for gas chromatographic analysis.
2.1 Baseline separation requires $R \geq 1.5$ for each pair of peaks (GCA/CA, i.s./GCA). $N$ can be calculated from $\mathrm{Nm}^{-1}$ value taking into account that the column length is 25 cm:
$N=2.56 \times 10^{4} \times(25 / 100)=64 \times 10^{2}$
By substituting of $\alpha, K$ and $N$ values in equation 1, the resolution for each pair of peaks can be found.

For column A:
$\alpha_{G C A / C A}=\frac{399-120}{380-120}=\frac{279}{260}=1.07$
$K_{G C A}^{\prime}=\frac{399-120}{120}=2.32$
$R_{G C A / C A}=\frac{\sqrt{64 \cdot 10^{2}}}{4} \times \frac{0.07}{1.07} \times \frac{2.32}{3.32}=0.91$
$\alpha_{i . S . / G C A}=\frac{422-120}{399-120}=\frac{322}{279}=1.15$
$K_{i, s .}^{\prime}=\frac{442-120}{120}=2.68$
$R_{i ., . / G C A}=\frac{\sqrt{64 \cdot 10^{2}}}{4} \times \frac{0.15}{1.15} \times \frac{2.68}{3.68}=1.9$

For column B:
$\alpha_{G C A / C A}=\frac{395-130}{350-130}=\frac{265}{220}=1.20$
$K_{\text {GCA }}^{\prime}=\frac{395-130}{130}=2.04$
$R_{G C A / C A}=\frac{\sqrt{64 \cdot 10^{2}}}{4} \times \frac{0.20}{1.20} \times \frac{2.04}{3.04}=2.2$
$\alpha_{i .5 . / G C A}=\frac{430-130}{395-130}=\frac{300}{265}=1.13$
$K_{i, s .}^{\prime}=\frac{430-130}{130}=2.31$
$R_{i . S, / G C A}=\frac{\sqrt{64 \cdot 10^{2}}}{4} \times \frac{0.13}{1.13} \times \frac{2.31}{3.31}=1.6$

For column B the minimum value of $R$ is $1.6(>1.5)$ so that complete separation is obtained. For column $\mathrm{A}, R=0.91(<1.5)$ for the pair GCA/CA which, then, is not completely separated. Therefore column B should be used.
2.2 The amount of acid in the extract solution $\left(1 \mathrm{~cm}^{3}\right)$ can be calculated from the relationship:
$\frac{\mu \text { moles }_{\text {acid }}}{\mu \text { moles }_{\text {i.s. }}}=\frac{\text { Area }_{\text {acid }}}{\text { Area }_{\text {i.s. }} \times F}$
where $F$ is the response factor.
Therefore:
$\mu$ moles $_{\text {acid }}=\frac{\text { Area }_{\text {acid }}}{\text { Area }_{\text {i.s. }} \times F} \times \mu$ moles $_{\text {i.s. }} \times \frac{1000}{100}$
$n(C A)=\frac{2200}{2304} \times \frac{1}{0.5} \times 2.7 \times 10=51.6 \mu \mathrm{~mol}$
$n(G C A)=\frac{3520}{2304} \times \frac{1}{0.2} \times 2.7 \times 10=206 \mu \mathrm{~mol}$

# THE TWENTY-SIXTH <br> INTERNATIONAL CHEMISTRY OLYMPIAD 3-11 JULY 1994, OSLO, NORWAY 

## THEORETICAL PROBLEMS

## PROBLEM 1

Lactic acid is formed in the muscles during intense activity (anaerobic metabolism). In the blood, lactic acid is neutralized by reaction with hydrogen carbonate. This will be illustrated by the following calculations:

Lactic acid written as HL is monoprotic, and the acid dissociation constant is $K_{\mathrm{HL}}=1.4 \times 10^{-4}$.

The acid dissociation constants for carbonic acid are: $K_{\mathrm{a} 1}=4.5 \times 10^{-7}$ and $K_{\mathrm{a} 2}=$ $4.7 \times 10^{-11}$. All carbon dioxide remains dissolved during the reactions.
1.1 Calculate pH in a $3.00 \times 10^{-3} \mathrm{M}$ solution of HL .
1.2 Calculate the value of the equilibrium constant for the reaction between lactic acid and hydrogen carbonate.
$1.33 .00 \times 10^{-3}$ mol of lactic acid $(\mathrm{HL})$ is added to $1.00 \mathrm{dm}^{3}$ of 0.024 M solution of $\mathrm{NaHCO}_{3}$ (no change in volume, HL completely neutralized).
i) Calculate the value of pH in the solution of $\mathrm{NaHCO}_{3}$ before HL is added.
ii) Calculate the value of pH in the solution after the addition of HL .
1.4 pH in the blood of a person changed from 7.40 to 7.00 due to lactic acid formed during physical activity. Let an aqueous solution having $\mathrm{pH}=7.40$ and $\left[\mathrm{HCO}_{3}^{-}\right]=$ 0.022 represent blood in the following calculation. How many moles of lactic acid have been added to $1.00 \mathrm{dm}^{3}$ of this solution when its pH has become 7.00 ?
1.5 In a saturated aqueous solution of $\mathrm{CaCO}_{3}(\mathrm{~s}) \mathrm{pH}$ is measured to be 9.95. Calculate the solubility of calcium carbonate in water and show that the calculated value for the solubility product constant $K_{s p}$ is $5 \times 10^{-9}$.
1.6 Blood contains calcium. Determine the maximum concentration of "free" calcium ions in the solution $\left(p H=7.40,\left[\mathrm{HCO}_{3}^{-}\right]=0.022\right)$ given in 1.4

## SOLUTION

1.1 $\mathrm{HL}+\mathrm{H}_{2} \mathrm{O} \rightarrow \mathrm{H}_{3} \mathrm{O}^{+}+\mathrm{L}^{-}: K_{\mathrm{HL}}=1.4 \times 10^{-4}$
$c_{0}-\mathrm{x} \quad \mathrm{x} \quad \mathrm{x}$
$K_{a}=\frac{\mathrm{x}^{2}}{c_{0}-\mathrm{x}}=1.4 \times 10^{-4} \quad c_{0}=3.00 \times 10^{-3}$
Assumption $c_{0} \gg x$ gives $x=6.5 \cdot 10^{-4}$, not valid
Quadratic formula: $x=5.8 \times 10^{-4},\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=5.8 \times 10^{-4}, \mathrm{pH}=3.24$
1.2 1: $\mathrm{HL}+\mathrm{HCO}_{3}^{-} \rightleftharpoons \mathrm{H}_{2} \mathrm{CO}_{3}+\mathrm{L}^{-} \quad: K_{1}$

2: $\mathrm{HL}+\mathrm{H}_{2} \mathrm{O} \rightleftharpoons \mathrm{H}_{3} \mathrm{O}^{+}+\mathrm{L}^{-} \quad: K_{2}=K_{\mathrm{HL}}$
3: $\mathrm{HCO}_{3}^{-}+\mathrm{H}_{3} \mathrm{O}^{+} \rightleftharpoons \mathrm{H}_{2} \mathrm{CO}_{3}+\mathrm{H}_{2} \mathrm{O} \quad: K_{3}=\frac{1}{K_{\mathrm{a} 1}}$
Reaction $1=2+3, K_{1}=K_{2} \cdot K_{3}=311 \quad\left(3.1 \times 10^{2}\right)$
Alternative: $K_{1}=\frac{\left[\mathrm{H}_{2} \mathrm{CO}_{3}\right]\left[\mathrm{L}^{-}\right]}{[\mathrm{HL}]\left[\mathrm{HCO}_{3}^{-}\right]} \times \frac{\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]}{\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]}=\frac{\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]\left[\mathrm{L}^{-}\right]}{[\mathrm{HL}]} \times \frac{\left[\mathrm{H}_{2} \mathrm{CO}_{3}\right]}{\left[\mathrm{HCO}_{3}^{-}\right]\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]}$
1.3 i) $\mathrm{HCO}_{3}^{-}$is amphoteric, $p H \approx \frac{1}{2}\left(p K_{a 1}+p K_{\mathrm{a} 2}\right)=8.34$
ii) $\quad \mathrm{HL}+\mathrm{HCO}_{3}^{-} \rightleftharpoons \mathrm{H}_{2} \mathrm{CO}_{3}+\mathrm{L}^{-}$, "reaction goes to completion"

Before: $0.00300 .024 \quad 0 \quad 0$
$\begin{array}{lllll}\text { After: } & 0 & 0.021 & 0.0030 & 0.0030\end{array}$
Buffer: $p H \approx p K_{a 1}+\log \frac{0.021}{0.0030}=6.35+0.85=7.20$
(Control: $\frac{K_{\mathrm{HL}}}{\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]}=\frac{\left[\mathrm{L}^{-}\right]}{[\mathrm{HL}]}=2.2 \times 10^{3}$, assumption is valid)
$1.4 \mathrm{~A}: \quad \mathrm{pH}=7.40 ; \quad\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=4.0 \times 10^{-8} ; \quad\left[\mathrm{HCO}_{3}^{-}\right]_{\mathrm{A}}=0.022$.
From $K_{\mathrm{a} 1}:\left[\mathrm{H}_{2} \mathrm{CO}_{3}\right]_{\mathrm{A}}=0.0019$;
(1) $\left[\mathrm{HCO}_{3}^{-}\right]_{\mathrm{B}}+\left[\mathrm{H}_{2} \mathrm{CO}_{3}\right]_{\mathrm{B}}=0.0239$

B: $\quad p H=7.00 ; \quad \frac{\left[\mathrm{HCO}_{3}\right]}{\left[\mathrm{H}_{2} \mathrm{CO}_{3}\right]}=4.5 ;$
(2) $\left[\mathrm{HCO}_{3}^{-}\right]_{\mathrm{B}}=4.5\left[\mathrm{H}_{2} \mathrm{CO}_{3}\right]_{\mathrm{B}}$

From (1) and (2): $\quad\left[\mathrm{HCO}_{3}^{-}\right]_{\mathrm{B}}=0.0196$
$\left[\mathrm{H}_{2} \mathrm{CO}_{3}\right]_{\mathrm{B}}=0.0043$
$n(\mathrm{HL})=\Delta n\left(\mathrm{H}_{2} \mathrm{CO}_{3}\right)=\Delta c\left(\mathrm{H}_{2} \mathrm{CO}_{3}\right) \times 1.00 \mathrm{dm}^{3}=2.4 \times 10^{-3} \mathrm{~mol}$
$1.5\left[\mathrm{OH}^{-}\right]=8.9 \times 10^{-5} \quad\left[\mathrm{H}_{2} \mathrm{CO}_{3}\right]$ of no importance
Reactions: $\quad \mathrm{A}: \quad \mathrm{CaCO}_{3}(\mathrm{~s}) \rightleftharpoons \mathrm{Ca}^{2+}+\mathrm{CO}_{3}^{2-}$
$c_{0} \quad c_{0}$
B: $\quad \mathrm{CO}_{3}^{2-}+\mathrm{H}_{2} \mathrm{O} \rightleftharpoons \mathrm{HCO}_{3}^{-}+\mathrm{OH}^{-} \quad K=K_{b}=2.1 \times 10^{-4}$ $c_{0}-\mathrm{x} \quad \mathrm{x} \quad \mathrm{x}$

From B: $\left[\mathrm{HCO}_{3}^{-}\right]=\left[\mathrm{OH}^{-}\right]=8.9 \times 10^{-5}$
$\left[\mathrm{CO}_{3}^{2-}\right]=\frac{\left[\mathrm{HCO}_{3}^{-}\right]\left[\mathrm{OH}^{-}\right]}{K_{\mathrm{b}}}=3.8 \times 10^{-5}$
$\left[\mathrm{Ca}^{2+}\right]=\left[\mathrm{HCO}_{3}^{-}\right]+\left[\mathrm{CO}_{3}^{2-}\right]=1.3 \times 10^{-4}$
$c_{0}\left(\mathrm{Ca}^{2+}\right)=1.3 \times 10^{-4} \mathrm{~mol} \mathrm{dm}^{-3}=$ solubility
$1.6 K_{s p}=\left[\mathrm{Ca}^{2+}\right]\left[\mathrm{CO}_{3}^{2-}\right]=1.3 \times 10^{-4} \times 3.8 \times 10^{-5}=4.9 \times 10^{-9}=5 \times 10^{-9}$
From $K_{a 2}: \quad\left[\mathrm{CO}_{3}^{2-}\right]=\frac{K_{a_{2}}\left[\mathrm{HCO}_{3}^{-}\right]}{\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]}=2.6 \times 10^{-5}$
$\mathrm{Q}=\left[\mathrm{Ca}^{2+}\right]\left[\mathrm{CO}_{3}^{2-}\right] ; \quad$ Precipitation when $\mathrm{Q}>K_{s p}=5 \times 10^{-9}$
No precipitation when $\mathrm{Q}<K_{s p}$
Max. concentration of "free" $\mathrm{Ca}^{2+}$ ions:
$\left[\mathrm{Ca}^{2+}\right]_{\max }=\frac{K_{s p}}{\left[\mathrm{CO}_{3}^{2-}\right]}=1.9 \times 10^{-4}$

## PROBLEM 2

Nitrogen in agricultural materials is often determined by the Kjeldahl method. The method involves a treatment of the sample with hot concentrated sulphuric acid, to convert organically bound nitrogen to ammonium ion. Concentrated sodium hydroxide is then added, and the ammonia formed is distilled into hydrochloric acid of known volume and concentration. The excess hydrochloric acid is then back-titrated with a standard solution of sodium hydroxide, to determine nitrogen in the sample.
2.1 0.2515 g of a grain sample was treated with sulphuric acid, sodium hydroxide was then added and the ammonia distilled into $50.00 \mathrm{~cm}^{3}$ of 0.1010 M hydrochloric acid. The excess acid was back-titrated with $19.30 \mathrm{~cm}^{3}$ of 0.1050 M sodium hydroxide. Calculate the concentration of nitrogen in the sample, in percent by mass.
2.2 Calculate the pH of the solution which is titrated in 2.1 when $0 \mathrm{~cm}^{3}, 9.65 \mathrm{~cm}^{3}$, $19.30 \mathrm{~cm}^{3}$ and $28.95 \mathrm{~cm}^{3}$ of sodium hydroxide have been added. Disregard any volume change during the reaction of ammonia gas with hydrochloric acid. $K_{a}$ for ammonium ion is $5.7 \times 10^{-10}$.
2.3 Draw the titration curve based on the calculations in b).
2.4 What is the pH transition range of the indicator which could be used for the back titration.
2.5 The Kjeldahl method can also be used to determine the molecular weight of amino acids. In a given experiment, the molecular weight of a naturally occurring amino acid was determined by digesting 0.2345 g of the pure acid and distilling ammonia released into $50.00 \mathrm{~cm}^{3}$ of 0.1010 M hydrochloric acid. A titration volume of 17.50 $\mathrm{cm}^{3}$ was obtained for the back titration with 0.1050 M sodium hydroxide.
Calculate the molecular weight of the amino acid based on one and two nitrogen groups in the molecule, respectively.

## SOLUTION

$2.1[(50.00 \times 0.1010)-(19.30 \times 0.1050)] \frac{14.01}{1000} \times \frac{100}{0.2515}=16.84 \% \mathrm{~N}$
$2.20 \mathrm{~cm}^{3}$ added: $\quad\left[\mathrm{H}^{+}\right]=\frac{19.30 \cdot 0.1050}{50}=0.04053$

$$
p H=1.39
$$

$9.65 \mathrm{~cm}^{3}$ added: $\quad\left[\mathrm{H}^{+}\right]==0.01699$

$$
p H=1.77
$$

$19.30 \mathrm{~cm}^{3}$ added: $\quad\left[\mathrm{H}^{+}\right]=\sqrt{5.710^{-10} \times \frac{50.000 \times 101019 \times 300 \times 1050}{50+19.30}}$

$$
p H=5.30
$$

$28.95 \mathrm{~cm}^{3}$ added: $\quad \boldsymbol{p} \boldsymbol{H}=\mathrm{p} K_{a}+\log \frac{\left[\mathrm{NH}_{3}\right]}{\left[\mathrm{NH}_{4}^{+}\right]}=9.24+\log \frac{1.01}{2.01}=8.94$

## 2.3

2.4 Indicator $p H$ transition range: $\mathrm{pH} 5.3 \pm 1$
$2.5[(50.00 \times 0.1010)-(17.50 \times 0.1050)] \frac{14.01}{1000} \times \frac{100}{0.2345}=19.19 \% \mathrm{~N}$
$1 \mathrm{~N}: M_{r}=73.01$
$2 \mathrm{~N}: M_{r}=146.02$

## PROBLEM 2

To control the quality of milk serum, a dairy by-product, the concentration of $\mathrm{NO}_{3}^{-}$ion in serum is monitored by means of an ion selective electrode. Generally there is about 15 $\mathrm{mg} \mathrm{NO}_{3}^{-}$ion per litre in serum, measured on the basis of nitrogen mass.
2.1 For a nitrate ion selective electrode a calibration curve as shown below was obtained using a series of standard nitrate solutions containing $0.5 \mathrm{~mol} \mathrm{dm}{ }^{-3} \mathrm{~K}_{2} \mathrm{SO}_{4}$, $1.0 \times 10^{-3} \mathrm{~mol} \mathrm{dm}^{-3} \mathrm{H}_{2} \mathrm{SO}_{4}$ and $2.6 \times 10^{-3} \mathrm{~mol} \mathrm{dm}^{-3} \mathrm{Cl}^{-}$ion as the background. Decide whether it is feasible to measure concentration $\mathrm{NO}_{3}^{-}$in serum under the above conditions.

2.2 Given are selective coefficients of $\mathrm{Cl}^{-}, \mathrm{SO}_{4}^{2-}$ and $\mathrm{ClO}_{4}^{-}$versus $\mathrm{NO}_{3}^{-}$as follow

$$
\begin{aligned}
& K_{\mathrm{NO}_{3}^{-}, \mathrm{Cr}}=\frac{c_{\mathrm{NO}_{3}^{3}}}{C_{\mathrm{Cr}}}=4.9 \times 10^{-2} \quad K_{\mathrm{NO}_{3}^{-}, \mathrm{SO}_{4}^{2-}}=\frac{c_{\mathrm{NO}_{3}}}{C_{\mathrm{SO}_{4}^{2-}}^{1 / 2}}=4.1 \times 10^{-3} \\
& K_{\mathrm{NO}_{3}, \mathrm{ClO}_{4}^{-}}=\frac{c_{\mathrm{NO}_{3}^{-}}}{C_{\mathrm{ClO}_{4}^{-}}}=1.0 \times 10^{-3}
\end{aligned}
$$

where the units of the concentrations are in $\mathrm{mol} \mathrm{dm}^{-3}$ which is the best to reduce the interference of $\mathrm{Cl}^{-}$to $\mathrm{NO}_{3}^{-}$determination, so as to control the error in the $\mathrm{NO}_{3}^{-}$ concentration within $1 \%$, when there are $1.40 \times 10^{-3} \mathrm{~mol} \mathrm{dm}^{-3} \mathrm{NO}_{3}^{-}$and $1.60 \times 10^{-2} \mathrm{~mol}$ $\mathrm{dm}^{-3} \mathrm{Cl}^{-}$in serum:
(a) $\mathrm{AgNO}_{3}$
(b) $\mathrm{Ag}_{2} \mathrm{SO}_{4}$
(c) $\mathrm{AgClO}_{4}$

Calculate the amount of the salt that should be added to $1 \mathrm{dm}^{3}$ of the sample solution to be measured.
2.3 The $\mathrm{NO}_{3}^{-}$ion concentration was determined by this method at 298 K . For $25.00 \mathrm{~cm}^{3}$ sample solution the electronic potential, $E$, is measured to be -160 mV . After adding $1.00 \mathrm{~cm}^{3} 1.00 \times 10^{-3} \mathrm{~mol} \mathrm{dm}^{-3} \mathrm{NO}_{3}^{-}$standard solution to the above solution, $\boldsymbol{E}$ changes to -130 mV . Find the $\mathrm{pNO}_{3}$ of the serum.
2.4 The selective coefficient of $\mathrm{CH}_{3} \mathrm{COO}^{-}$versus $\mathrm{NO}_{3}^{-} K\left(\mathrm{NO}_{3}^{-} / \mathrm{CH}_{3} \mathrm{COO}^{-}\right)=2.7 \times 10^{-3}$. If $\mathrm{AgCH}_{3} \mathrm{COO}$ instead of $\mathrm{Ag}_{2} \mathrm{SO}_{4}$ is added to the sample solution of question 2.2, find the upper limit of the pH value below which the same requirement in question 2.2 can be met.
$K_{\text {sp }}(\mathrm{AgCl})=3.2 \times 10^{-10} K_{\text {sp }}\left(\mathrm{Ag}_{2} \mathrm{SO}_{4}\right)=8.0 \times 10^{-5}$
$K_{\text {sp }}\left(\mathrm{AgCH}_{3} \mathrm{COO}\right)=8.0 \times 10^{-3} \quad K_{\mathrm{a}}\left(\mathrm{CH}_{3} \mathrm{COOH}\right)=2.2 \times 10^{-5}$
$A_{r}(\mathrm{~N})=14.00$

## SOLUTION

### 2.1 Yes

2.2 B
$\left(1.4 \times 10^{-3} \times 0.01\right) /[\mathrm{Cl}]=4.9 \times 10^{-4} \mathrm{~mol} \mathrm{dm}^{-3}$
$[\mathrm{Cl}]=2.9 \times 10^{-4} \mathrm{~mol} \mathrm{dm}^{-3}$
Excess $[\mathrm{CI}]=1.6 \times 10^{-2}-2.9 \times 10^{-3} \cong 1.6 \times 10^{-2} \mathrm{~mol} \mathrm{dm}^{-3}$
To reduce the interference of $\mathrm{Cl}^{-}$at least $1.6 \times 10^{-2} \mathrm{~mol} \mathrm{Ag}$ ion or $8.0 \times 10^{-3} \mathrm{~mol}$ $\mathrm{Ag}_{2} \mathrm{SO}_{4}$ has to be added to $1 \mathrm{dm}^{3}$ sample solution.
$2.3 \Delta E=E_{2}-E_{1}=0.059 \log \left\{\left(c_{x} V_{x}+c_{s} V_{s}\right)\left(c_{x}\left[V_{x}+V_{s}\right]\right)\right\}$
$0.03=0.059 \log \left[\left(25.00 V_{x}+0.10\right) /\left(26.00 \times c_{x}\right)\right]$
$c_{x}=1.7 \times 10^{-3} \mathrm{~mol} \mathrm{dm}^{-3}$
$p \mathrm{NO}_{3}=2.77$
$2.4 \mathrm{pH}=4.4$
$\left(1.4 \times 10^{-3} \times x\right) \div 1.6 \times 10^{-2}=2.7 \times 10^{-3}$
$x=3.1 \%>1 \%$
$\left(1.4 \times 10^{-3} \times 0.01\right) \div\left[\mathrm{CH}_{3} \mathrm{COO}^{-}\right]=2.7 \times 10^{-3}$
$\left[\mathrm{CH}_{3} \mathrm{COO}\right]=5.2 \times 10^{-3} \mathrm{~mol} \mathrm{dm}^{-3}$
$1.6 \times 10^{-2}-5.2 \times 10^{-3}=1.08 \times 10^{-2} \mathrm{~mol} \mathrm{dm}^{-3}$
$\left\{\left[\mathrm{H}^{+}\right] \times 5.2 \times 10^{-3}\right\} \div\left(1.08 \times 10^{-2}\right)=2.2 \times 10^{-5}$
$\left[\mathrm{H}^{+}\right]=4.3 \times 10^{-5} \mathrm{~mol} \mathrm{dm}^{-3}$
$p H=4.4$

## PROBLEM 6

A surfactant molecule can generally be modelled as Fig. 1 where a circle presents the polar head (PH), i.e. the hydrophilic part of the molecule, and a rectangle represents the non-polar tail (NT), i. e. the hydrophobic part of the molecule.

Fig. 1
6.1 AOT is a surfactant. Its systematic name (IUPAC name) is sulfobutanedioic acid 1,4-bis-(2-ethylhexyl) ester sodium salt (formula $\mathrm{C}_{20} \mathrm{H}_{37} \mathrm{NaO}_{7} \mathrm{~S}$ ).
i) Write the structural formula for AOT and fill its PH and NT in the circle and rectangle on your answer sheet.
ii) Choose the type of surfactant AOT among the following.
a) Non-ionic;
b) Anionic;
c) Cationic;
d) Others.
6.2 Mixing an aqueous solution of 50 mmol AOT with isooctane (volume ratio $1: 1$ ), a micellar extraction system will be formed in the isooctane phase (organic phase).
i) Using the model as shown in Fig. 1, draw a micelle with 10 AOT molecules under the given condition.
ii) What species are in the inner cavity of this micelle? Write their chemical formulas.
6.3 There is an aqueous solution containing the proteins as listed below:

| Protein | Molecular mass $\left(M_{r}\right) \times 10^{4}$ | Isoelectronic point (PI) |
| :---: | :---: | :---: |
| A | 1.45 | 11.1 |
| B | 1.37 | 7.8 |
| C | 6.45 | 4.9 |
| D | 6.80 | 4.9 |
| E | 2.40 | 4.7 |
| F | 2.38 | 0.5 |

The separation of proteins can be performed by mixing the AOT micellar extraction system with the solution. Adjusting the pH value of the solution to 4.5 , only three of the above listed six proteins can be extracted into the micelles. Which proteins will be extracted?
6.4 The three proteins entered into the micelles will be separated from each other by the following procedure shown as in Fig. 2. Each extracted protein can be sequentially transported into a respective water phase.

Fig. 2
Note: (w) represents water phase; (o) represents organic phase

Fill the three extracted proteins in the left boxes first and then separate them by the procedure given, and give the separation conditions above each arrow as well.

## SOLUTION

6.1 i)

ii) (b)
6.2 i)

### 6.3 A, B, and E.

## 6.4

## PROBLEM 2

The detection limit is one of the basic parameters in quantitative analysis of trace amounts of elements. The detection limit is expressed as the least mass of an element which can be determined by a given method with a given accuracy.

As an example we shall consider the method used for the determination of microscopic amounts of bismuth. In 1927 German chemist Berg suggested to precipitate bismuth as a practically insoluble salt: 8-hydroxyquinolinium tetraiodobismuthate $\left[\mathrm{C}_{9} \mathrm{H}_{6}(\mathrm{OH}) \mathrm{NH}\right]\left[\mathrm{Bil}_{4}\right]\left(M_{r}=862.7\right)$.
2.1 a) Draw the structural formulae of the cation and anion of this salt.
b) What is the oxidation state of Bi atom in this compound?
2.2 Evaluate the smallest mass of bismuth (in mg ), which can be determined reliably by Berg method, if the smallest mass of precipitate which can be reliably measured is 50.0 mg .

For the determination of trace amounts of bismuth R. Belcher and co-workers from Birmingham developed a multiplicative method. According to this method a chain of reactions followed by a titration of the final product is carried out. A detailed description follows.

Step 1: To a given small amount ( $\approx 2 \mathrm{~cm}^{3}$ ) of cold acidified solution containing trace amounts of $\mathrm{Bi}^{3+} 50 \mathrm{mg}$ of potassium hexathiocyanatochromate(III) $\left(\mathrm{K}_{3}\left[\mathrm{Cr}(\mathrm{SCN})_{6}\right]\right)$ is added in the cold, that leads to practically quantitative precipitation of bismuth.
2.3 Write a balanced net ionic equation of this reaction.

Step 2: The precipitate is filtered off, washed by cold water, and treated with $5 \mathrm{~cm}^{3}$ of 10 \% solution of sodium hydrogen carbonate. Upon this treatment the initial precipitate transforms into the precipitate of oxobismuth(III) carbonate $(\mathrm{BiO})_{2} \mathrm{CO}_{3}$ with liberation of hexathiocyanatochromate(III) ions into solution.
2.4 Write a balanced net ionic equation of this reaction.

Step 3: To the slightly acidified filtrate transferred to a separatory funnel $0.5 \mathrm{~cm}^{3}$ of saturated iodine solution in chloroform are added, and the mixture is vigorously shaken. Iodine oxidizes the ligand of the complex ion to ICN and sulphate ion.
2.5 Write a balanced net ionic equation of this reaction.

Step 4: Upon 5 minutes $4 \mathrm{~cm}^{3}$ of $2 \mathrm{M} \mathrm{H}_{2} \mathrm{SO}_{4}$ solution are added to the mixture. The acidification leads to the reaction of coproportionation with the evolution of molecular iodine.
2.6 Write a balanced net ionic equation of the reaction occurred on acidification.

Step 5: lodine is quantitatively extracted by 4 portions of chloroform. Aqueous layer is transferred to a flask, to which $1 \mathrm{~cm}^{3}$ of bromine water is added, and the mixture is mixed for 5 minutes.
2.7 Write the balanced net ionic equations of the reactions occurred upon the addition of bromine water. Note that an excess of bromine can react with hydrogen cyanide to give BrCN , and iodide is oxidized into $\mathrm{IO}_{3}{ }^{-}$.

Step 6: To eliminate an excess of molecular bromine $3 \mathrm{~cm}^{3}$ of $90 \%$ methanoic (formic) acid is added to the mixture.
2.8 Write a balanced net ionic equation of this reaction.

Step 7: To the slightly acidic solution an excess ( 1.5 g ) of potassium iodide is added.
2.9 Write the balanced net ionic equations of the reactions occurred upon the addition of KI , taking into consideration that iodide reacts with BrCN in a similar manner as with ICN to form molecular iodine.

Step 8: The resulting solution is titrated by a standard $0.00200 \mathrm{M} \mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3}$ solution. The results thus obtained are used to calculate the content of bismuth in the sample taken for analysis.
2.10 a) How many moles of thiosulphate are equivalent to 1 mol of bismuth in the initial sample?
b) What is the least mass of bismuth which can be determined by this method (assume that reliable determination requires no less than $1 \mathrm{~cm}^{3}$ of standard $0.00200 \mathrm{M} \mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3}$ solution)?
2.11 By how many times the multiplicative method just described is more sensitive than Berg's gravimetric method?

## SOLUTION

2.1 a)

Cation
Anion
b)

The oxidation number of bismuth in 8-hydroxyquinolinium tetraiodobismuthate: III
2.2 The smallest mass of bismuth determined reliably by Berg method, 12.1 mg .

Molar mass of the precipitate is 862.7 g , which contains 209.0 g of bismuth. Thus, 0.0500 g of the precipitate correspond to $1.21 \times 10^{-2} \mathrm{~g}=12.1 \mathrm{mg}$ of bismuth.
$2.3 \mathrm{Bi}^{3+}+\left[\mathrm{Cr}(\mathrm{SCN})_{6}\right]^{3-} \longrightarrow \mathrm{Bi}\left[\mathrm{Cr}(\mathrm{SCN})_{6}\right]$.
$2.42 \mathrm{Bi}\left[\mathrm{Cr}(\mathrm{SCN})_{6}\right]+6 \mathrm{HCO}_{3}^{-} \longrightarrow(\mathrm{BiO})_{2} \mathrm{CO}_{3}+2\left[\mathrm{Cr}(\mathrm{SCN})_{6}\right]^{3-}+3 \mathrm{H}_{2} \mathrm{O}+5 \mathrm{CO}_{2}$ or
$2 \mathrm{Bi}\left[\mathrm{Cr}(\mathrm{SCN})_{6}\right]+\mathrm{HCO}_{3}^{-}+5 \mathrm{OH}^{-} \longrightarrow(\mathrm{BiO})_{2} \mathrm{CO}_{3}+2\left[\mathrm{Cr}(\mathrm{SCN})_{6}\right]^{3-}+3 \mathrm{H}_{2} \mathrm{O}$ etc.
(variations are possible)
$2.5\left[\mathrm{Cr}(\mathrm{SCN})_{6}\right]^{3-}+24 \mathrm{I}_{2}+24 \mathrm{H}_{2} \mathrm{O} \longrightarrow \mathrm{Cr}^{3+}+6 \mathrm{SO}_{4}^{2-}+6 \mathrm{ICN}+42 \mathrm{I}^{-}+48 \mathrm{H}^{+}$
2.6 $\mathrm{ICN}+\mathrm{I}^{-}+\mathrm{H}^{+} \longrightarrow \mathrm{I}_{2}+\mathrm{HCN}$
2.7 a)
$3 \mathrm{Br}_{2}+\mathrm{I}^{-}+3 \mathrm{H}_{2} \mathrm{O} \longrightarrow \mathrm{IO}_{3}^{-}+6 \mathrm{Br}^{-}+6 \mathrm{H}^{+}$
b)
$\mathrm{Br}_{2}+\mathrm{HCN} \longrightarrow \mathrm{BrCN}+\mathrm{Br}^{-}+\mathrm{H}^{+}$
Comment: From reaction 2.5 it is evident that considerably more of ions l- are formed than of ICN molecules. Therefore, after the completion of reaction 2. 6 an excess of $I^{-}$ions will be left.
$2.8 \mathrm{Br}_{2}+\mathrm{HCOOH} \longrightarrow 2 \mathrm{Br}^{-}+\mathrm{CO}_{2}+2 \mathrm{H}^{+}$
2.9 a)

$$
\mathrm{IO}_{3}^{-}+5 \mathrm{I}^{-}+6 \mathrm{H}^{+} \longrightarrow 3 \mathrm{I}_{2}+3 \mathrm{H}_{2} \mathrm{O}
$$

b)
$\mathrm{BrCN}+2 \mathrm{I}^{-}+\mathrm{H}^{+} \longrightarrow \mathrm{I}_{2}+\mathrm{HCN}+\mathrm{Br}^{-}$

### 2.10 a)

228 moles of thiosulphate correspond to 1 mole of bismuth.
b)

The least mass of bismuth, $1.83 \cdot 10^{-3} \mathrm{mg}$

## Solution:

a)

Titration of iodine by thiosulphate involves the reaction:
$\mathrm{I}_{2}+2 \mathrm{~S}_{2} \mathrm{O}_{3}^{2-} \longrightarrow 2 \mathrm{I}^{-}+\mathrm{S}_{4} \mathrm{O}_{6}^{2-}$.
Assume that the initial solution contained 1 mole of Bi . In the reaction 5 each mole of Bi leads to the formation of 42 moles of iodide (for convenience divide all coefficients of reaction 4 by 2), of which 6 moles of iodide-ion was consumed in reaction 2.6. Thus, 36 moles of iodide was consumed in reaction 2.7a) to give 36 moles of $\mathrm{IO}_{3}^{-}$, which in reaction 2.9 a) gave $36 \times 3=108$ moles of $I_{2}$, which take $108 \times 2=216$ moles of thiosulphate for titration. However, that is not all. Indeed, 6 moles of HCN are generated per mole of $\mathrm{Bi}^{3+}$ according to reactions 2.5 and 2.6. The oxidation of HCN by bromine in reaction 2.7b) gives 6 moles of BrCN , which in its turn in reaction 2.9b) gives 6 moles of iodine taking 12 more moles of thiosulphate. Thus, total amount of thiosulphate is $216+12=228$.
b)
$1.00 \mathrm{~cm}^{3}$ of 0.00200 M thiosulphate solution contains $2.00 \times 10^{-6}$ mole of $\mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3}$, which corresponds to $209.0 \times 2.00 \times 10^{-6} / 228=1.83 \times 10^{-6} \mathrm{~g}=1.83 \times 10^{-3} \mathrm{mg}=$ $=1.83 \mu \mathrm{~g}$.
2.11 $\frac{\text { Detection limit of gravimetric method }}{\text { Detection limit of multiplicated method }}=6600$

The multiplicative method is more sensitive than the gravimetric method by $12.1 \mathrm{mg} / 1.83 \times 10^{-3} \mathrm{mg}=6600$ times.

## PROBLEM 4

The precipitation is widely used in classical methods of the quantitative and qualitative analysis for the separation of ions. The possibility of separation is determined by the equilibrium concentrations of all species in a solution to be analyzed.

Potassium dichromate is one of the most widely used precipitating reagents. The following equilibria are established in aqueous solutions of $\mathrm{Cr}(\mathrm{VI})$.

$$
\begin{array}{ll}
\mathrm{HCrO}_{4}^{-} \rightleftarrows \mathrm{H}^{+}+\mathrm{CrO}_{4}^{2-} & \log K_{1}=-6.50 \\
2 \mathrm{HCrO}_{4}^{-} \rightleftarrows \mathrm{Cr}_{2} \mathrm{O}_{7}^{2-}+\mathrm{H}_{2} \mathrm{O} & \log K_{2}=1.36
\end{array}
$$

4.1 Calculate the equilibrium constants
a) $\mathrm{CrO}_{4}^{2-}+\mathrm{H}_{2} \mathrm{O} \rightleftarrows \mathrm{HCrO}_{4}^{-}+\mathrm{OH}^{-}$
b) $\mathrm{Cr}_{2} \mathrm{O}_{7}^{2-}+2 \mathrm{OH}^{-} \rightleftarrows 2 \mathrm{CrO}_{4}^{2-}+\mathrm{H}_{2} \mathrm{O}$

The ionic product of water $K_{w}=1.0 \times 10^{-14}$.
4.2 In what direction shall the equilibrium state 1 b shift upon the addition of the following reagents to the aqueous solution of potassium dichromate?
a) KOH
b) HCl
c) $\mathrm{BaCl}_{2}$
d) $\mathrm{H}_{2} \mathrm{O}$

The solubility product of $\mathrm{BaCrO}_{4}$ is $1.2 \times 10^{-10}$. $\mathrm{BaCr}_{2} \mathrm{O}_{7}$ is well soluble in water.
4.3 Calculate the pH value of the following solutions
a) $\quad 0.010 \mathrm{M} \mathrm{K}_{2} \mathrm{CrO}_{4}$
b) $\quad 0.010 \mathrm{M} \mathrm{K}_{2} \mathrm{Cr}_{2} \mathrm{O}_{7}$
c) $\quad 0.010 \mathrm{M} \mathrm{K}_{2} \mathrm{Cr}_{2} \mathrm{O}_{7}+0.100 \mathrm{M} \mathrm{CH}_{3} \mathrm{COOH}$

Dissociation constant of acetic acid $\mathrm{K}_{\mathrm{a}}=1.8 \times 10^{-5}$.
4.4 Calculate the equilibrium concentrations of the following ions in the solution of $0.010 \mathrm{M} \mathrm{K}_{2} \mathrm{Cr}_{2} \mathrm{O}_{7}+0.100 \mathrm{M} \mathrm{CH}_{3} \mathrm{COOH}$
a) $\mathrm{CrO}_{4}^{2-}$
b) $\mathrm{Cr}_{2} \mathrm{O}_{7}^{2-}$
$\mathrm{Pb}^{2+}$ and $\mathrm{Ag}^{+}$form poorly soluble compounds with chromate and dichromate ions.
The solubility products of these compounds are indicated below.

| $\mathrm{PbCrO}_{4}$ | $K_{\mathrm{s} 1}=1.2 \times 10^{-14}$ |
| :--- | :--- |
| $\mathrm{Ag}_{2} \mathrm{CrO}_{4}$ | $K_{\mathrm{s} 2}=1.3 \times 10^{-12}$ |
| $\mathrm{Ag}_{2} \mathrm{Cr}_{2} \mathrm{O}_{7}$ | $\mathrm{~K}_{\mathrm{s} 3}=1.1 \times 10^{-10}$ |

To the aqueous solution of the mixture of $1.0 \times 10^{-3} \mathrm{M} \mathrm{Pb}\left(\mathrm{NO}_{3}\right)_{2}$ and $2.0 \times 10^{-4} \mathrm{M}$ $\mathrm{AgNO}_{3}$ an equal volume of 0.020 M solution of $\mathrm{K}_{2} \mathrm{Cr}_{2} \mathrm{O}_{7}$ in $0.200 \mathrm{M} \mathrm{CH}_{3} \mathrm{COOH}$ was added.
4.5 a) Shall $\mathrm{Pb}^{2+}$ be precipitated?
b) Shall $\mathrm{Ag}^{+}$be precipitated?
c) Shall a quantitative separation of $\mathrm{Pb}^{2+}$ and $\mathrm{Ag}^{+}$ions be thus achieved?

The quantitative precipitation is achieved if the residual concentration of the ion being precipitated is not higher than $1 \times 10^{-6} \mathrm{M}$.

## SOLUTION

## 4.1

a)

Equilibrium constant $=3.2 \times 10^{-8}$

$$
\begin{aligned}
& \frac{\left[\mathrm{HCrO}_{4}^{-}\right]\left[\mathrm{OH}^{-}\right]}{\left[\mathrm{CrO}_{4}^{2-}\right]}=\frac{\left[\mathrm{HCrO}_{4}^{-}\right]\left[\mathrm{OH}^{-}\right]\left[\mathrm{H}^{+}\right]}{\left[\mathrm{CrO}_{4}^{2-}\right]\left[\mathrm{H}^{+}\right]}=\frac{K_{w}}{K_{1}} \\
& \frac{1.0 \times 10^{-14}}{3.16 \times 10^{-7}}=3.2 \times 10^{-8}
\end{aligned}
$$

b) Equilibrium constant $>4.4 \times 10^{13}$

$$
\frac{K_{1}^{2}}{K_{2} K_{w}^{2}}=\frac{\left(\frac{\left[\mathrm{CrO}_{4}{ }^{2-}\right]\left[\mathrm{H}^{+}\right]}{\left[\mathrm{HCrO}_{4}^{-}\right]}\right)^{2}}{\frac{\left[\mathrm{HCrO}_{4}^{-}\right]^{2}}{\left[\mathrm{Cr}_{2} \mathrm{O}_{7}^{2-}\right]}} \frac{10^{-2 \times 6.50}}{\left.1\left[\mathrm{H}^{+}\right]\left[\mathrm{OH}^{-}\right]\right)^{2}} \times 10^{-2 \times 14.00}=10^{13.64}=4.4 \times 10^{13}
$$

4.2 Place a checkmark at the correct answer

| The equilibrium will | shift to left | shift to right | not shift |
| :---: | :---: | :---: | :--- |
| a) |  | $\nabla$ |  |
| b) | $\nabla$ |  |  |
| c) |  | $\nabla$ |  |
| d) |  | $\nabla$ |  |

Calculations:
In case $a$ ) and b) the answer is self-evident.
c) $\mathrm{BaCl}_{2}$ shifts the equilibrium to the right due to the binding of chromate ion into a poorly soluble compound

$$
\mathrm{Ba}^{2+}+\mathrm{CrO}_{4}{ }^{2-} \rightarrow \mathrm{BaCrO}_{4}
$$

d) This answer may appear as strange, as water is among the products specified in the right part of the equilibrium equation. However, this is too formal. Actually in dilute aqueous solutions the concentration of water may be regarded as fairly constant and the addition of water would not affect it. Nevertheless, the addition of water to dichromate solution leads to the dilution, which in its turn shifts the dichromate ion dissociation equilibrium to the right. Second, in the aqueous solution of $\mathrm{K}_{2} \mathrm{Cr}_{2} \mathrm{O}_{7}$ the value of $\mathrm{pH}<7$ due to the processes described in the problem statement (cf. also the solution to 3b). With the dilution of any aqueous solution pH is varying towards 7 , that in this case means the increase of pH . This also shifts the equilibrium to the right.
4.3 a) $\mathrm{pH}=9.25$
b) $\mathrm{pH}=4.20$
c) $\mathrm{pH}=2.87$

Calculations:
a) $\quad \mathrm{CrO}_{4}^{2-}+\mathrm{H}_{2} \mathrm{O}=\mathrm{HCrO}_{4}^{-}+\mathrm{OH}^{-} \quad \mathrm{K}=3.16 \times 10^{-8}$

$$
\begin{aligned}
& \mathrm{Crr}=\left[\mathrm{CrO}_{4}^{2-}\right]+\left[\mathrm{HCrO}_{4}^{-}\right]+2\left[\mathrm{Cr}_{2} \mathrm{O}_{7}^{2-}\right] \approx\left[\mathrm{CrO}_{4}^{2-}\right] \\
& {\left[\mathrm{HCrO}_{4}^{-}\right] \approx[\mathrm{OH}]}
\end{aligned}
$$

$$
\begin{aligned}
& {\left[\mathrm{OH}^{-}\right]^{2} / \mathrm{c}_{\mathrm{Cr}}=\mathrm{K},\left[\mathrm{OH}^{-}\right]=\sqrt{K c_{C r}}=\sqrt{3.16 \times 10^{-8} \times 0.01}=1.78 \times 10^{-5}} \\
& {\left[\mathrm{H}^{+}\right]=5.65 \cdot 10^{-10}, \quad \mathrm{pH}=9.25}
\end{aligned}
$$

b) $\quad \mathrm{Cr}_{2} \mathrm{O}_{7}^{2-}+\mathrm{H}_{2} \mathrm{O}=2 \mathrm{HCrO}_{4}^{-} \quad K=1 / K_{2}=4.37 \times 10^{-2}$
$\mathrm{HCrO}_{4}^{-}=\mathrm{H}^{+}+\mathrm{CrO}_{4}^{2-} \quad K=K_{1}=3.16 \times 10^{-7}$
$\left[\mathrm{H}^{+}\right] \approx\left[\mathrm{CrO}_{4}^{2-}\right] \Rightarrow\left[\mathrm{H}^{+}\right]=\sqrt{\mathrm{K}_{1}\left[\mathrm{HCrO}_{4}^{2-}\right]}$
$\left[\mathrm{HCrO}_{4}^{-}\right]=$?
$c_{\mathrm{Cr}}=2.0 \cdot 10^{-2} \mathrm{M}\left(^{* *}\right)=\left[\mathrm{CrO}_{4}^{2-}\right]+\left[\mathrm{HCrO}_{4}^{-}\right]+2\left[\mathrm{Cr}_{2} \mathrm{O}_{7}^{2-}\right] \approx\left[\mathrm{HCrO}_{4}^{-}\right]+2\left[\mathrm{Cr}_{2} \mathrm{O}_{7}^{2-}\right]$
$\left[\mathrm{HCrO}_{4}^{-}\right]=\mathrm{x} ; \mathrm{K}_{2}=\left[\mathrm{Cr}_{2} \mathrm{O}_{7}^{2-}\right] /\left[\mathrm{HCrO}_{4}^{-}\right]^{2}=\left(c_{\mathrm{Cr}}-\mathrm{x}\right) / 2 \mathrm{x}^{2} ; 2 \mathrm{~K}_{2} \mathrm{x}^{2}+\mathrm{x}-c_{\mathrm{Cr}}=0$ hence $\left[\mathrm{H}^{+}\right]=\left(3.16 \times 10^{-7} \times 1.27 \times 10^{-2}\right)^{1 / 2}=6.33 \times 10^{-5} ; \mathrm{pH}=4.20$
c) $\quad$ In $0.10 \mathrm{M} \mathrm{CH}_{3} \mathrm{COOH}\left[\mathrm{H}^{+}\right]=\left(K_{a} c\right)^{1 / 2 /}\left(^{*}\right)=\left(1.8 \times 10^{-5} \times 0.10\right)^{1 / 2}=1.34 \times 10^{-3}$ $p H=2.87$

### 4.4 Equilibrium concentrations

| a) | $3.0 \times 10^{-6}$ |
| :--- | :--- |
| b) | $3.7 \times 10^{-3}$ |

Calculations:
The different methods can be used.

## Method 1.

a)
$\left[\mathrm{HCrO}_{4}{ }^{-}\right]=1.3 \times 10^{-2}\left(^{*}\right)$
$\left[\mathrm{CrO}_{4}^{2-}\right]=K_{1}\left[\mathrm{HCrO}_{4}^{-}\right] /\left[\mathrm{H}^{+}\right]=3.16 \times 10^{-7} \times 1.3 \times 10^{-2} / 1.34 \times 10^{-3}=3.0 \times 10^{-6}$
b)

$$
c_{\mathrm{Cr}}=\left[\mathrm{CrO}_{4}^{2-}\right]+\left[\mathrm{HCrO}_{4}^{-}\right]+2\left[\mathrm{Cr}_{2} \mathrm{O}_{7}^{2-}\right]
$$

$\left[\mathrm{Cr}_{2} \mathrm{O}_{7}^{2-}\right]=1 / 2\left(\mathrm{C}_{\mathrm{Cr}}-\left[\mathrm{CrO}_{4}^{2-}\right]-\left[\mathrm{HCrO}_{4}^{-}\right]\right)=1 / 2\left(2.0 \times 10^{-2}-3.0 \times 10^{-6}-1.3 \times 10^{-2}\right)=3.7 \times 10^{-3}$
or otherwise
$\left[\mathrm{Cr}_{2} \mathrm{O}_{7}^{2-}\right]=K_{2}\left[\mathrm{HCrO}_{4}^{-}\right]^{2}=22.9 \times\left(1.3 \times 10^{-2}\right)^{2}=3.9 \times 10^{-3}$

## Method 2

a)
$\left[\mathrm{CrO}_{4}^{2-}\right]=\mathrm{x} ;\left[\mathrm{HCrO}_{4}^{-}\right]=\mathrm{x}\left[\mathrm{H}^{+}\right] / K_{1}$
$\left[\mathrm{Cr}_{2} \mathrm{O}_{7}^{2-}\right]=K_{2}\left[\mathrm{HCrO}_{4}^{-}\right]=\mathrm{x}^{2} K_{2}\left[\mathrm{H}^{+}\right]^{2} / K_{1}^{2}$
$c_{\mathrm{Cr}}=\left[\mathrm{CrO}_{4}^{2-}\right]+\left[\mathrm{HCrO}_{4}^{-}\right]+2\left[\mathrm{Cr}_{2} \mathrm{O}_{7}^{2-}\right]=2 K_{2}\left[\mathrm{H}^{+}\right]^{2} / K_{1}^{2} \mathrm{x}^{2}+\left(1+\left[\mathrm{H}^{+}\right] / K_{1}\right) \mathrm{x}$
$K_{1}=3.16 \times 10^{-7} ; K_{2}=22.9 ;\left[\mathrm{H}^{+}\right]=1.34 \times 10^{-3}$
$8.24 \times 10^{8} x^{2}+4.24 \times 10^{3} x-2.0 \times 10^{-2}=0$
$x=3.0 \times 10^{-6}$
b)

$$
\left[\mathrm{Cr}_{2} \mathrm{O}_{7}^{2-}\right]=K_{2}\left[\mathrm{HCrO}_{4}^{-}\right]=K_{2}\left[\mathrm{H}^{+}\right]^{2} / K_{1}^{2}\left[\mathrm{CrO}_{4}^{2-}\right]^{2}=4.12 \times 10^{8} \times\left(3.0 \times 10^{-6}\right)^{2}=3.7 \times 10^{-3}
$$

## PROBLEM 5

Potentiometric and spectrophotometric methods are widely used for the determination of equilibrium concentrations and equilibrium constants in solution. Both methods are frequently used in combination to achieve simultaneous determination of several species.

Solution I contains a mixture of $\mathrm{FeCl}_{2}(\mathrm{aq})$ ) and $\mathrm{FeCl}_{3}(\mathrm{aq})$, and solution II contains a mixture of $\mathrm{K}_{4} \mathrm{Fe}(\mathrm{CN})_{6}$ and $\mathrm{K}_{3} \mathrm{Fe}(\mathrm{CN})_{6}$. The concentrations of iron-containing species satisfy the relations $\left[\mathrm{Fe}^{2+}\right]_{1}=\left[\mathrm{Fe}(\mathrm{CN})_{6}^{4-}\right]_{\|}$and $\left[\mathrm{Fe}^{3+}\right]_{\mid}=\left[\mathrm{Fe}(\mathrm{CN})_{6}^{3-}\right]_{\|}$. The potential of platinum electrode immersed into the solution I is 0.652 V , while the potential of platinum electrode immersed into solution II is 0.242 V . The transmittance of the solution II measured relative to the solution I at 420 nm is 10.7 \% (optical pathlength $I=5.02 \mathrm{~mm}$ ). The complexes $\mathrm{Fe}(\mathrm{CN})_{6}^{4-}, \mathrm{Fe}\left(\mathrm{H}_{2} \mathrm{O}\right)_{6}^{3+}$, and $\mathrm{Fe}\left(\mathrm{H}_{2} \mathrm{O}\right)_{6}^{2+}$ do not absorb light at 420 nm .

Molar absorption at this wavelength $\varepsilon\left(\left[\mathrm{Fe}(\mathrm{CN})_{6}^{3-}\right]\right)=1100 \mathrm{M}^{-1} \mathrm{~cm}^{-1}$.
Standard redox potential for $\mathrm{Fe}\left(\mathrm{H}_{2} \mathrm{O}\right)_{6}^{3+} / \mathrm{Fe}\left(\mathrm{H}_{2} \mathrm{O}\right)_{6}^{2+}$ is 0.771 V .
The factor before the logarithm in the Nernst equation is 0.0590 .
5.1 Write Nernst equations for redox systems of
a) solution I,
b) solution II.
5.2 What are the units of the pre-logarithm factor 0.0590 in the Nernst equation?
5.3 Calculate the ratio of the stability constants $\beta\left[\mathrm{Fe}(\mathrm{CN})_{6}^{3-}\right] / \beta\left[\mathrm{Fe}(\mathrm{CN})_{6}^{4-}\right]$.
5.4 What is the absolute range of variation for the following physical values
a) transmittance $T$;
b) absorbance $A$.
5.5 Sketch the graphs of concentration dependences satisfying the Lambert-Beer law for
a) absorbance $A$;
b) transmittance $T$;
c) molar absorption $\varepsilon$.
5.6 Calculate the concentrations of
a) $\mathrm{Fe}^{2+}$ in solution $\mathbf{I}$;
b) $\mathrm{Fe}^{3+}$ in solution II.
5.7 Mixing solutions I and II gives intense blue colour. What species is characterized by this colour? Write the reaction equation.

## SOLUTION

5.1 Nernst equations:
a) $E_{1}=E^{o}\left(\mathrm{Fe}^{3+} / \mathrm{Fe}^{2+}\right)+0.0590 \log \frac{\left[\mathrm{Fe}^{3+}\right]}{\left[\mathrm{Fe}^{2+}\right]}$
b) $\quad E_{1}=E^{\circ}\left(\mathrm{Fe}(\mathrm{CN})_{6}{ }^{3-} / \mathrm{Fe}(\mathrm{CN})_{6}{ }^{4-}\right)+0.0590 \log \frac{\left[\mathrm{Fe}(\mathrm{CN})_{6}{ }^{3-}\right]}{\left[\mathrm{Fe}(\mathrm{CN})_{6}{ }^{4-}\right]}$
5.2 The units of pre-logarithm factor: V
5.3 The ratio of stability constants
$\beta\left\{\mathrm{Fe}(\mathrm{CN})_{6}{ }^{3}\right\} / \beta\left\{\mathrm{Fe}(\mathrm{CN})_{6}{ }^{4-}\right\}=8.90 \times 10^{6}$

Calculations:

$$
\begin{aligned}
E_{l /}= & E^{\circ}\left(\mathrm{Fe}(\mathrm{CN})_{6}^{3-} / \mathrm{Fe}(\mathrm{CN})_{6}^{4-}\right)+0.0590 \log \left[\mathrm{Fe}(\mathrm{CN})_{6}^{3-} / \mathrm{Fe}(\mathrm{CN})_{6}^{4-}\right]= \\
= & E^{\circ}\left(\mathrm{Fe}^{3+} / \mathrm{Fe}^{2+}\right)+0.0590 \log \left(\beta_{1} / \beta_{2}\right)+0.0590 \log \left(\left[\mathrm{CN}^{-}\right]^{6} /\left[\mathrm{CN}^{-}\right]^{6}\right)+ \\
& +0.0590 \log \left[\mathrm{Fe}(\mathrm{CN})_{6}^{3-} / \mathrm{Fe}(\mathrm{CN})_{6}^{4-}\right]=0.242
\end{aligned}
$$

(where $\beta_{1}$ and $\beta_{2}$ are stability constants for $\mathrm{Fe}(\mathrm{CN})_{6}^{4-}$ and $\mathrm{Fe}(\mathrm{CN})_{6}^{3-}$, respectively.)
$\left[\mathrm{Fe}(\mathrm{CN})_{6}^{3-}\right] /\left[\mathrm{Fe}(\mathrm{CN})_{6}^{4-}\right]=\left[\mathrm{Fe}^{3+}\right] /\left[\mathrm{Fe}^{2+}\right]$, therefore
$\Delta E=E_{\|}-E_{I}=0.0590 \cdot \log \left(\beta_{1} / \beta_{2}\right)$, and $\beta_{2} / \beta_{1}=8.90 \times 10^{6}$.
5.4 The ranges of variation:
a) from 0 to 100
b) from 0 to $\infty$

## 5.5

| a) | b) | c) |
| :---: | :---: | :---: |
|  |  |  |

5.6 a) Using Bouger-Lambert-Beer law

$$
\begin{aligned}
& A=\varepsilon / C=\varepsilon / c\left[\mathrm{Fe}(\mathrm{CN})_{6}^{3-}\right]=0.971 ; \\
& c\left[\mathrm{Fe}(\mathrm{CN})_{6}^{3-}\right]=0.971 /(1100 \times 0.502)=1.76 \times 10^{-3} \mathrm{M}=c\left[\mathrm{Fe}^{3+}\right]
\end{aligned}
$$

b) using Nernst's equation

$$
\begin{aligned}
E & =E^{\circ}\left(\mathrm{Fe}^{3+} / \mathrm{Fe}^{2+}\right)+0.0590 \log \left[\mathrm{Fe}^{3+}\right]_{I} /\left[\mathrm{Fe}^{2+}\right]_{I}= \\
& =0.771+0.0590 \log \left[\mathrm{Fe}^{3+}\right]_{I} /\left[\mathrm{Fe}^{2+}\right]_{I}=0.652 \mathrm{~V} .
\end{aligned}
$$

hence,

$$
\begin{aligned}
& {\left[\mathrm{Fe}^{3+}\right]_{I} /\left[\mathrm{Fe}^{2+}\right]_{I}=9.62 \times 10^{-3} ;} \\
& {\left[\mathrm{Fe}^{2+}\right]_{I}=1.76 \times 10^{-3} / 9.62 \times 10^{-3}=0.183 \mathrm{M} .}
\end{aligned}
$$

## PROBLEM 4

Graph paper is provided for your optional use in this question.
If you choose to use it, print your name and identification code in the upper right corner of the graph paper.

HIn is a weakly acidic indicator.
$\mathrm{HIn}+\mathrm{Na}+\mathrm{OH}-\mathrm{Na}+\mathrm{In}-+\mathrm{H}_{2} \mathrm{O}$
also written as
$\mathrm{HIn} \rightleftarrows \mathrm{In}-+\mathrm{H}^{+}$

At normal temperatures, the acid dissociation constant for this indicator is $K_{\mathrm{a}}=2.93 \times 10^{-5}$. The absorbance data ( 1.00 cm cells) for $5.00 \times 10^{-4} \mathrm{M}\left(\mathrm{mol} \mathrm{dm}^{-3}\right)$ solutions of this indicator in strongly acidic and strongly alkaline solutions are given in the following table.

Absorbance Data (A)

| $\lambda, \mathrm{nm}$ | $p H=1.00$ | $p H=13.00$ |  |
| :--- | :--- | :--- | :--- |
|  |  |  |  |
| 400 | 0.401 | 0.067 |  |
| 470 | 0.447 | 0.050 |  |
| 485 | 0.453 | 0.052 |  |
| 490 | 0.452 | 0.054 |  |
| 505 | 0.443 | 0.073 |  |
| 535 | 0.390 | 0.170 |  |
| 555 | 0.342 | 0.342 |  |
| 570 | 0.303 | 0.515 |  |
| 585 | 0.263 | 0.648 |  |
| 615 | 0.195 | 0.816 |  |
| 625 | 0.176 | 0.823 |  |
| 635 | 0.170 | 0.816 |  |
| 650 | 0.137 | 0.763 |  |
| 680 | 0.097 | 0.588 |  |

4.1 Predict the observed colour of the a) acidic and b) basic forms of the indicator.

Using a " 50 nm wide bar", shade the appropriate area of the wavelength scale on the answer sheet which would correspond to the colour of the indicator at the pH values given in the table.

For example, if observed colour is green, your answer would appear as:

|  | blue | green | yellow | red |
| :---: | :---: | :---: | :---: | :---: |
| violet |  |  |  |  |
| wavelength $(\mathrm{nm})$ |  |  |  |  |

4.2 A filter is located between the light source and the sample. What colour filter would be most suitable for the photometric analysis of the indicator in a strongly acidic medium?
4.3 What wavelength range would be most suitable for the photometric analysis of the indicator in a strongly basic medium?
4.4 What would be the absorbance of a $1.00 \times 10^{-4} \mathrm{M}(\mathrm{mol} \mathrm{dm}-3)$ solution of the indicator in alkaline form if measured at 545 nm in a 2.50 cm cell?
4.5 Solutions of the indicator were prepared in a strongly acidic solution $(\mathrm{HCl}, \mathrm{pH}=1)$ and in a strongly basic solution $(\mathrm{NaOH}, \mathrm{pH}=13)$. Perfectly linear relationships between absorbance and concentration were observed in both media at 490 nm and 625 nm, respectively.

The molar absorptivities at the two wavelengths are:

|  | $\lambda=490 \mathrm{~nm}$ | $\lambda=625 \mathrm{~nm}$ |
| :---: | :---: | :---: |
| $\mathrm{HIn}(\mathrm{HCl})$ | $9.04 \times 10^{2} \mathrm{M}^{-1} \mathrm{~cm}^{-1}$ | $3.52 \times 10^{2} \mathrm{M}^{-1} \mathrm{~cm}^{-1}$ |
| $\mathrm{In}-(\mathrm{NaOH})$ | $1.08 \times 10^{2} \mathrm{M}^{-1} \mathrm{~cm}^{-1}$ | $1.65 \times 10^{3} \mathrm{M}^{-1} \mathrm{~cm}^{-1}$ |

$$
\left(\mathrm{M}=\mathrm{mol} \mathrm{dm}^{-3}\right)
$$

Calculate the absorbance ( 1.00 cm cell) at the two wavelengths for an aqueous $1.80 \times 10^{-3} \mathrm{M}\left(\mathrm{mol} \mathrm{dm}^{-3}\right)$ solution of the indicator HIn.

## SOLUTION

4.1 The observed colour will be the complementary colour to that of the absorption maximum.
a) Acidic conditions $(\mathrm{pH} 1)$ :

The sample absorbs at $490 \pm 25$ (blue-green) and thus will transmit the complementary colour and will appear to be yellow-orange ( $625 \pm 25 \mathrm{~nm}$ ).
b) Basic conditions ( pH 13 ):

The sample absorbs at $625 \pm 25$ (yellow-orange) and thus will transmit the complementary colour and will appear to be blue-green ( $490 \pm 25 \mathrm{~nm}$ ).
4.2 The filter should transmit the colour that the sample will absorb most efficiently. The acidic sample absorbs most strongly in the blue range ( $490 \pm 25 \mathrm{~nm}$ ) and thus a similar colour filter would be most suitable for the photometric analysis of the sample.
4.3 The wavelength range to be used for maximum sensitivity should correspond to that at which the sample absorbs most strongly. The maximum absorbance for the basic form of the indicator in solution occurs at $625 \pm 25 \mathrm{~nm}$ and this is the most suitable wavelength for the analysis.
4.4 From a graph of $A$ versus wavelength, the absorbance of a $5.00 \times 10^{-4} \mathrm{M}$ basic solution at 545 nm is 0.256 . From the plot, it is clear that this region of the graph is linear and thus the above value can also be interpolated from the data table.
$A=\varepsilon l c \quad$ (Beer's Law)
where $I=$ length of cell, $c=$ concentration of analyte, $\varepsilon=$ molar absorptivity.
Therefore $\varepsilon=\underline{A}=\underline{0.256}=5.12 \times 10^{2} \mathrm{M}^{-1} \mathrm{~cm}^{-1}$

$$
I c=1.0 \times 5.00 \times 10^{-4}
$$

Absorbance of a $1.00 \times 10^{-4} \mathrm{M}$ basic solution of the indicator using a 2.50 cm cell is:
$A=5.12 \times 10^{2} \times 2.50 \times 1.0 \times 10^{-4}=0.128$
4.5 The dissociation reaction of the indicator is:
$[\mathrm{HIn}]=\left[\mathrm{H}_{+}\right]+[\mathrm{ln}-]$
accordingly,

$$
\begin{equation*}
\left[\mathrm{H}_{+}\right]=[\mathrm{ln}-] \tag{1}
\end{equation*}
$$

and
$[\mathrm{HIn}]+[\mathrm{In}-]=1.80 \times 10^{-3} \mathrm{M}$

$$
\begin{equation*}
K_{\mathrm{a}}=\frac{\left[\mathrm{H}^{+}\right]\left[\mathrm{ln}^{-}\right]}{[\mathrm{HIn}]} \tag{3}
\end{equation*}
$$

Substitute (1) and (2) into (3)

$$
K_{\mathrm{a}}=\frac{\left[\mathrm{In}^{-}\right]^{2}}{1.8 \times 10^{-3}-\left[\mathrm{In}^{-}\right]}=2.93 \times 10^{-5}
$$

Rearrangement yields the quadratic expression
$[\mathrm{In}-]^{2}+2.93 \times 10^{-5}[\mathrm{In}-]-5.27 \times 10^{-8}=0$
which results in
$[\mathrm{ln}-]=2.15 \times 10^{-4} \mathrm{M}$
[HIn] $=1.80 \times 10^{-3} \mathrm{M}-2.15 \times 10^{-4} \mathrm{M}=1.58 \times 10^{-3} \mathrm{M}$
The absorbance at the two wavelengths are then:

$$
\begin{aligned}
& A_{490}=\left(9.04 \times 10^{2} \times 1 \times 1.58 \times 10^{-3}\right)+\left(1.08 \times 10^{2} \times 1 \times 2.15 \times 10^{-4}\right)=1.45 \\
& A_{625}=\left(3.52 \times 10^{2} \times 1 \times 1.58 \times 10^{-3}\right)+\left(1.65 \times 10^{3} \times 1 \times 2.15 \times 10^{-4}\right)=0.911
\end{aligned}
$$

## PROBLEM 8

An electrolyte is prepared from $\mathrm{H}_{2} \mathrm{SO}_{4}, \mathrm{CuSO}_{4}$ and distilled water and its volume is $100.0 \mathrm{~cm}^{3}$. The concentrations of $\mathrm{H}+$ and $\mathrm{Cu}^{2+}$ in the electrolyte are $c\left(\mathrm{H}^{+}\right)=1.000 \mathrm{M}$ $\left(\mathrm{mol} \mathrm{dm}^{-3}\right)$ and $c\left(\mathrm{Cu}^{2+}\right)=1.000 \times 10^{-2} \mathrm{M}\left(\mathrm{mol} \mathrm{dm}^{-3}\right)$, respectively. Two cubic platinum electrodes are immersed in the electrolyte. Both of the electrodes are single crystals with only one face (100) exposed to the electrolyte (the other five faces are blocked physically by an insulator which is stable in the electrolyte). The exposed surface area of each electrode is equal to $1.000 \mathrm{~cm}^{2}$. During an electrolysis a total charge of 2.0000 C is passed between the cathode and the anode. At the cathode, two simultaneous processes are occurring: deposition of an epitaxial (layer-by-layer) Cu layer and $\mathrm{H}_{2}$ gas generation. At the anode, $\mathrm{O}_{2}$ gas is generated. The $\mathrm{H}_{2}$ gas is collected in a flask under the following conditions (assume ideal gas behaviour):
$T=273.15 \mathrm{~K}$ and $P\left(\mathrm{H}_{2}\right)=1.01325 \times 10^{4} \mathrm{~Pa}$; the volume of $\mathrm{H}_{2}$ is equal to $2.0000 \mathrm{~cm}^{3}$
8.1 Write equations of the processes taking place at the electrodes.
8.2 Calculate the number of moles of $\mathrm{H}_{2}$ gas generated at the cathode and the number of moles of Cu deposited on the electrode.
8.3 Calculate the number of Cu monolayers formed on the Pt (100) cathode.

Note that the lattice constant of Pt is $a(\mathrm{Pt})=3.9236 \times 10^{-8} \mathrm{~cm}$.
Both Pt and Cu have the fcc (face centred cubic) crystallographic structure.
Molar masses and constants:

```
\(M(H)=1.00795 \mathrm{~g} \mathrm{~mol}^{-1}\)
\(M(\mathrm{Cu})=63.546 \mathrm{~g} \mathrm{~mol}^{-1}\)
\(e=1.60218 \times 10^{-19} \mathrm{C}\)
\(F=96485.3 \mathrm{C} \mathrm{mol}^{-1}\)
\(R=8.314510 \mathrm{~J} \mathrm{~K}^{-1} \mathrm{~mol}^{-1}=0.0820584 \mathrm{~L} \mathrm{~atm} \mathrm{~K}^{-1} \mathrm{~mol}^{-1}\)
\(V_{m}=22.4141 \mathrm{dm}^{3}\)
\(1 \mathrm{~atm}=1.01325 \times 10^{5} \mathrm{~Pa}\)
\(N_{A}=6.02214 \times 10^{23} \mathrm{~mol}^{-1}\)
```

## SOLUTION

## Approach

- Determine the number of $\mathrm{H}_{2}$ moles generated by the electrolysis.
- Calculate the charge required for the $\mathrm{H}_{2}$ production and the charge of the formation of the Cu deposit and thus the number of moles of Cu in the deposit.
- Calculate the surface concentration of atoms in the Pt (100) face thus the number of Pt atoms per $1 \mathrm{~cm}^{2}$; during an epitaxial growth the number of Cu atoms per $1 \mathrm{~cm}^{2}$ equals the number of Pt atoms
- Determine the charge necessary to form one monolayer of Cu and subsequently the number of Cu monolayers on Pt (100)

## Calculations

### 8.1 Balanced electrode equations

(a) Anode: $2 \mathrm{H}_{2} \mathrm{O} \rightarrow \mathrm{H}^{+}+\mathrm{O}_{2}+4 \mathrm{e}^{-}$
(b) Cathode:

Two reactions occur simultaneously at the cathode:

$$
\begin{aligned}
& 2 \mathrm{H}^{+}+2 \mathrm{e}^{-} \rightarrow \mathrm{H}_{2} \\
& \mathrm{Cu}^{2+}+2 \mathrm{e}^{-} \rightarrow \mathrm{Cu}
\end{aligned}
$$

8.2 Determination of the charge necessary to generate $2.0000 \mathrm{~cm}^{3}$ of $\mathrm{H}_{2}$ gas ( $T=273.15 \mathrm{~K}, p=10.1325 \mathrm{kPa}$ )
Two approaches to determination of the number of $\mathrm{H}_{2}$ gas moles
(a) Determination of $n\left(\mathrm{H}_{2}\right): p V=n\left(\mathrm{H}_{2}\right) R T$

$$
\begin{aligned}
& n\left(\mathrm{H}_{2}\right)=\frac{10132.5 \times 2.0000 \times 10^{-6}}{8.314510 \times 273.15}=8.9230 \times 10^{-6} \mathrm{~mol} \\
& n\left(\mathrm{H}_{2}\right)=\frac{V\left(\mathrm{H}_{2}\right)}{V_{m}}
\end{aligned}
$$

$V_{m}=22.4141 \mathrm{dm}^{3} \mathrm{~mol}^{-1}\left(V_{m}\right.$ refers to the pressure of 1 atm or at $p\left(\mathrm{H}_{2}\right)=101.325 \mathrm{kPa}$ and because the pressure of $\mathrm{H}_{2}$ is ten times smaller, one knows right away that the volume occupied under 1 atm would be $0.2000 \mathrm{~cm}^{3}$ )

$$
n\left(\mathrm{H}_{2}\right)=\frac{0.20000 \times 10^{-3}}{22.4141}=8.9230 \times 10^{-6} \mathrm{~mol}
$$

Determination of the charge necessary to generate $8.9230 \times 10^{-6}$ moles of $\mathrm{H}_{2}$ gas
Two approaches to determination of the charge:
(a) the number of H atoms, $N_{\mathrm{H}}$, equals twice the number of $\mathrm{H}_{2}$ molecules; if one multiplies $N_{H}$ by e, then one gets the sought charge, $Q_{H}$
$Q_{H}=2 \times 8.9230 \times 10^{-6} \times N_{A} \times 1.60218 \times 10^{-19}$
$Q_{\mathrm{H}}=1.7219 \mathrm{C}$
(b) one may use the Faraday law

$$
m_{\mathrm{H}}=k_{\mathrm{H}} Q_{\mathrm{H}}
$$

where $k_{H}$ is the electrochemical equivalent of H thus the mass of H generated by 1 C ; to use this formula one has to calculate $k_{\mathrm{H}}$; knowing that the charge of $1 \mathrm{~F}=96485.3 \mathrm{C}$ results in formation of 1 mole of $\mathrm{H}\left(1 / 2\right.$ mole of $\left.\mathrm{H}_{2}\right)$, one may easily determine $k_{H}$
$\frac{96485.3}{1.00795}=\frac{1.0000}{k_{\mathrm{H}}}$
$k_{\mathrm{H}}=1.04467 \times 10^{-5} \mathrm{~g} \mathrm{C}^{-1}$
Subsequently
$Q_{H}=\frac{m_{H}}{k_{\mathrm{H}}}=\frac{2 \times 8.9230 \times 10^{-6} \times 1.00795}{1.04467 \times 10^{-5}}$
$Q_{\mathrm{H}}=1.7219 \mathrm{C}$

Determination of the Cu deposition charge
$Q_{\mathrm{Cu}}=2.0000-Q_{\mathrm{H}}$
$Q_{\mathrm{Cu}}=2.0000-1.7219=0.2781 \mathrm{C}$
The moles of Cu is thus $0.2781 / 2 \mathrm{~F}=1.4412 \times 10^{-6}$

### 8.3 Determination of the charge of formation of 1 monolayer (ML) of the Cu deposit and

 the number of Cu monolayers on the $\mathrm{Pt}(100)$ substrateCalculate the number of surface Pt atoms in the (100) face
Surface area of the fundamental unit:
$A_{u}=a_{\mathrm{Pt}}^{2}=1.5395 \times 10^{-15} \mathrm{~cm}^{2}$

Number of atoms per fundamental (100) unit: $n_{u}=2$
Surface atom concentration:
$S_{\mathrm{Pt}(100)}=\frac{n_{u}}{A_{u}}=\frac{2}{1.5395 \times 10^{-15} \mathrm{~cm}^{2}}=1.2991 \times 10^{15} \mathrm{~cm}^{-2}$
The number of Cu atoms per $1 \mathrm{~cm}^{2}$ equals the number of Pt atoms - epitaxial growth
$\sigma_{\mathrm{Cu}(100)}=\sigma_{\mathrm{Pt}(100)}=1.2991 \times 10^{15} \mathrm{~cm}^{-2}$
The charge of formation of one monolayer (ML) of Cu equals:

$$
\begin{aligned}
& q_{\mathrm{ML}}=2 \times e \times 1.2991 \times 10^{15} \\
& q_{\mathrm{ML}}=4.1628 \times 10^{-4} \mathrm{C}
\end{aligned}
$$

Determination of the number of Cu monolayers on the $\mathrm{Pt}(100)$ substrate
$n_{\text {ML }}=\frac{0.2780 \mathrm{C}}{4.1628 \times 10^{-4} \mathrm{C}}$
$n_{M L}=668 \mathrm{ML}$
One can also calculate the number of Cu atoms $\left(8.6802 \times 10^{17}\right)$ formed from the number of moles produced and divide this by the number of atoms $\left(1.2991 \times 10^{15}\right)$ on the exposed Pt surface to also arrive at 668 monolayers.

## THE THIRTIETH

INTERNATIONAL CHEMISTRY OLYMPIAD
5-14 JULY 1998, MELBOURNE, AUSTRALIA

## THEORETICAL PROBLEMS

## PROBLEM 1

The following 8 steps describe the procedure for analysing a sample of alloy that contains both tin and lead.

1. A 0.4062 g sample of alloy was dissolved by heating it in a small beaker with a mixture of 11 M hydrochloric and 16 M nitric acid. The beaker was heated until the entire alloy dissolved. In this procedure, lead is oxidised to $\mathrm{Pb}(\mathrm{II})$ and tin becomes $\mathrm{Sn}(\mathrm{IV})$.
2. After 5 minutes of heating to expel oxides of nitrogen and chlorine, some acid remained. When the solution was cooled, a precipitate of some tin compounds and a lead compound appeared.
3. A $25.00 \mathrm{~cm}^{3}$ aliquot of $0.2000 \mathrm{M} \mathrm{Na}_{2} \mathrm{H}_{2} E D T A$ solution was added. The precipitate dissolved and a clear, colourless solution was obtained.
4. This solution was quantitatively transferred to a $250.0 \mathrm{~cm}^{3}$ volumetric flask and made up to the mark with distilled water.
5. A $25.00 \mathrm{~cm}^{3}$ aliquot of this solution was treated with $15 \mathrm{~cm}^{3}$ of a $30 \% \mathrm{w} / \mathrm{v}$ solution of hexamine (hexamethylenetetramine), some water and two drops of Xylenol Orange solution. The pH of each aliquot was 6.
6. The clear, yellow solution from Step 5 was titrated with standard 0.009970 M lead nitrate solution until the colour just changed from yellow to red. The titre at this endpoint was $24.05 \mathrm{~cm}^{3}$.
7. 2.0 g of solid NaF was added to the titration flask. The solution turned back to yellow.
8. The solution was titrated with more standard 0.009970 M lead nitrate solution until the colour changed to red again. The titre at this endpoint was $15.00 \mathrm{~cm}^{3}$.

Hexamine and Xylenol Orange have the structures shown below. The $p K_{b}$ of hexamine is 9.5. Xylenol Orange is red below pH 4 , yellow above pH 5.

Xylenol Orange (XO)
Hexamine
$K_{\mathrm{MY}}$ is the conditional formation constant $=\alpha K_{\mathrm{MY}}$.
$K_{\mathrm{MY}}$ for the formation of the EDTA complexes of $\mathrm{Pb}(\mathrm{II})$ and $\mathrm{Sn}(\mathrm{IV})$, in the presence and absence of fluoride, are shown in the following Figure.

1.1 What is the lead compound that precipitates in Step 2?
1.2 Write a balanced ionic equation that explains the disappearance of the precipitate in Step 3 (at pH 6 ).
1.3 What is the purpose of hexamine in Step 5 of the analysis?
1.4 What is the purpose of Xylenol Orange in the analysis?
1.5 Write balanced ionic equations for the reactions occurring during the titration and responsible for the colour change at the endpoint in Step 6 of the analysis
1.6 What is the purpose of NaF in Step 7 of the analysis?
1.7 Write a balanced ionic equation for the reaction that occurs in Step 7.
1.8 Write a balanced ionic equation that explains why the colour changed from red to yellow in Step 7 of the analysis.
1.9 Write a balanced ionic equation that explains why the lines on the graph below of $\log K_{M Y}$ vs $p H$ for $\mathrm{Pb}+$ EDTA and $\mathrm{Pb}+$ EDTA $+\mathrm{F}^{-}$are coincident below pH 2 .
1.10 Calculate the percentage by weight of Sn and Pb in the alloy.

## SOLUTION

1.1 $\mathrm{PbCl}_{2}$ or any hydroxo species etc.
$1.2 \mathrm{PbCl}_{2}(\mathrm{~s})+\mathrm{H}_{2} \mathrm{Y}^{2-} \rightarrow \mathrm{PbY}^{2-}+2 \mathrm{H}^{+}+2 \mathrm{Cl}^{-}$or similar
1.3 It forms a pH buffer.
1.4 It is a metallochromic indicator.
1.5 (i) The reaction that occurs during the titration:

$$
\mathrm{Pb}^{2+}+\mathrm{H}_{2} \mathrm{Y}^{2-} \rightarrow \mathrm{PbY}^{2-}+2 \mathrm{H}^{+}
$$

(ii) At the endpoint, a slight excess of $\mathrm{Pb}^{2+}$ forms a red complex with the xylenol orange indicator:

$$
\mathrm{Pb}^{2+}+\mathrm{XO}(\text { yellow }) \rightarrow \mathrm{PbXO}^{2+}(\text { red })
$$

1.6 The role of the NaF : It forms a complex with tin.
1.7 From the graph of $\log K_{\text {Mr }}$ vs $p H$, it can be seen that the fluoride forms a stable complex with $\mathrm{Sn}^{4+}$ but not with $\mathrm{Pb}^{2+}$ at pH 6 , displacing EDTA:
$\mathrm{SnY}+\mathrm{nF}^{-}+2 \mathrm{H}^{+} \rightarrow \mathrm{SnF}_{\mathrm{n}}^{(\mathrm{n}-4)-}+\mathrm{H}_{2} \mathrm{Y}^{2-}$ where n is typically $4-6$.
1.8 The released EDTA destroys the small amount of red PbXO complex, producing free (yellow) XO . (Charge on XO ignored)
$\mathrm{H}_{2} \mathrm{Y}^{2-}+\mathrm{PbXO}^{2+} \rightarrow \mathrm{PbY}^{2-}+\mathrm{XO}$ (yellow) $+2 \mathrm{H}^{+}$
1.9 Below $\mathrm{pH} 2, \mathrm{~F}^{-}$is protonated and does not compete effectively with Y for $\mathrm{Pb}^{2+}$ $\mathrm{H}^{+}+\mathrm{F}^{-} \rightarrow \mathrm{HF}$.
1.10 The percentage by mass of Sn and Pb in the alloy:

The amount of EDTA in excess from the amount of standard $\mathrm{Pb}^{2+}$ titrant:
$n($ EDTA $)=n\left(\mathrm{~Pb}^{2+}\right)=0.02405 \mathrm{dm}^{3} \times 0.009970 \mathrm{~mol} \mathrm{dm}^{-3}=2.398 \times 10^{-4} \mathrm{~mol}$.

The original amount of EDTA:
$n\left(\right.$ EDTA $_{\text {jnit. }}=0.1 \times 25.00 \mathrm{dm}^{3} \times 0.2000 \mathrm{~mol} \mathrm{dm}^{-3}=5.000 \times 10^{-4} \mathrm{~mol}$
EDTA consumed by the $\mathrm{Pb}^{2+}$ and $\mathrm{Sn}^{4+}$ in a $25 \mathrm{~cm}^{3}$ aliquot:
$n(\text { EDTA })_{\text {consumed }}=5.000 \times 10^{-4}-2.398 \times 10^{-4} \mathrm{~mol}=2.602 \times 10^{-4} \mathrm{~mol}=n\left(\mathrm{~Pb}^{2+}+\mathrm{Sn}^{4+}\right)$ in a $25 \mathrm{~cm}^{3}$ aliquot.

The amount of EDTA released from SnY by reaction with fluoride:
$n(\text { EDTA })_{\text {released }}=n\left(\mathrm{~Pb}^{2+}\right)_{\text {stand. }}=15.00 \mathrm{~cm}^{3} \times 0.009970 \mathrm{~mol} \mathrm{dm}^{-3}=1.496 \times 10^{-4} \mathrm{~mol}=$
$=n\left(\mathrm{Sn}^{4+}\right)$ in the $25 \mathrm{~cm}^{3}$ aliquot
in a $25 \mathrm{~cm}^{3}$ aliquot $n\left(\mathrm{~Pb}^{2+}\right)=\left(2.602 \times 10^{-4}-1.496 \times 10^{-4}\right) \mathrm{mol}=1.106 \times 10^{-4} \mathrm{~mol}$
In the original 0.4062 g sample of alloy:
$m(\mathrm{Sn})=10 \times 1.496 \times 10^{-4} \mathrm{~mol} \times 118.69 \mathrm{~g} \mathrm{~mol}^{-1}=0.1776 \mathrm{~g}$
$m(\mathrm{~Pb})=10 \times 1.106 \times 10^{-4} \mathrm{~mol} \times 207.19 \mathrm{~g} \mathrm{~mol}^{-1}=0.2292 \mathrm{~g}$
The percentages of tin and lead:
Sn: $100 \times(0.1776 / 0.4062)=43.7 \%$
$\mathrm{Pb}: 100 \times(0.2292 / 0.4062)=56.4 \%$

## PROBLEM 5

Metallic gold frequently is found in aluminosilicate rocks and it is finely dispersed among other minerals. It may be extracted by treating the crushed rock with aerated sodium cyanide solution. During this process metallic gold is slowly converted to $\left[\mathrm{Au}(\mathrm{CN})_{2}\right]^{-}$, which is soluble in water (reaction 1).

After equilibrium has been reached, the aqueous phase is pumped off and the metallic gold is recovered from it by reacting the gold complex with zinc, which is converted to $\left[\mathrm{Zn}(\mathrm{CN})_{4}\right]^{2-}$ (reaction 2).
5.1 Write balanced ionic equations for reactions (1) and (2).

Gold in nature is frequently alloyed with silver which is also oxidized by aerated sodium cyanide solution.
5.2 Five hundred litres ( 500 L ) of a solution 0.0100 M in $\left[\mathrm{Au}(\mathrm{CN})_{2}\right]^{-}$and 0.0030 M in $\left[\mathrm{Ag}(\mathrm{CN})_{2}\right]^{-}$was evaporated to one third of the original volume and was treated with zinc ( 40 g ). Assuming that deviation from standard conditions is unimportant and that all these redox reactions go essentially to completion, calculate the concentrations of $\left[\mathrm{Au}(\mathrm{CN})_{2}\right]^{-}$and of $\left[\mathrm{Ag}(\mathrm{CN})_{2}\right]^{-}$after reaction has ceased.
$\left[\mathrm{Zn}(\mathrm{CN})_{4}\right]^{2-}+2 \mathrm{e}^{-} \rightarrow \mathrm{Zn}+4 \mathrm{CN}^{-} \quad E^{\circ}=-1.26 \mathrm{~V}$
$\left[\mathrm{Au}(\mathrm{CN})_{2}\right]^{-}+\mathrm{e}^{-} \rightarrow \mathrm{Au}+2 \mathrm{CN}^{-} \quad E^{\circ}=-0.60 \mathrm{~V}$
$\left[\mathrm{Ag}(\mathrm{CN})_{2}\right]^{-}+\mathrm{e}^{-} \rightarrow \mathrm{Ag}+2 \mathrm{CN}^{-} \quad E^{\circ}=-0.31 \mathrm{~V}$
5.3 $\left[\mathrm{Au}(\mathrm{CN})_{2}\right]^{-}$is a very stable complex under certain conditions. What concentration of sodium cyanide is required to keep $99 \mathrm{~mol} \%$ of the gold in solution in the form of the cyanide complex? $\quad\left\{\left[\mathrm{Au}(\mathrm{CN})_{2}\right]^{-}: K_{f}=4 \times 10^{28}\right\}$
5.4 There have been several efforts to develop alternative gold extraction processes which could replace this one. Why? Choose one of the options on the answer sheet.

## SOLUTION

### 5.1 Reaction 1:

$$
4 \mathrm{Au}+8 \mathrm{CN}^{-}+\mathrm{O}_{2}+2 \mathrm{H}_{2} \mathrm{O} \rightarrow 4\left[\mathrm{Au}(\mathrm{CN})_{2}\right]^{-}+4 \mathrm{OH}^{-}
$$

reaction 2:
$\mathrm{Zn}+2\left[\mathrm{Au}(\mathrm{CN})_{2}\right]^{-} \rightarrow\left[\mathrm{Zn}(\mathrm{CN})_{4}\right]^{2-}+2 \mathrm{Au}$
$5.2 E^{0}(\mathrm{Ag} / \mathrm{Zn})=-0.31-(-1.26)=0.95 \mathrm{~V}$
$E^{0}(\mathrm{Au} / \mathrm{Zn})=-0.60-(-1.26)=0.66 \mathrm{~V}$
$E^{0}(\mathrm{Ag} / \mathrm{Zn})>E^{0}(\mathrm{Au} / \mathrm{Zn})$
Therefore the $\mathrm{Ag}(\mathrm{I})$ complex will be reduced first.
(i) $\mathrm{mol} \mathrm{Ag}(\mathrm{l})$ in $500 \mathrm{dm}^{3}=500 \times 0.0030=1.5 \mathrm{~mol}$
(ii) $\mathrm{mol} \mathrm{Au}(\mathrm{I})$ in $500 \mathrm{dm}^{3}=500 \times 0.010=5.0 \mathrm{~mol}$
(iii) mol Zn in $40 \mathrm{~g}=40 / 65.38=0.61 \mathrm{~mol}$

1 mol zinc reacts with 2 mol of $\mathrm{Ag}(\mathrm{I})$ or $\mathrm{Au}(\mathrm{I})$
Therefore 0.61 mol Zn will consume $1.2 \mathrm{~mol}\left[\mathrm{Ag}(\mathrm{CN})_{2}\right]^{-}$
$\left[\mathrm{Ag}(\mathrm{CN})_{2}\right]^{-}$remaining $=1.5-1.2=0.3 \mathrm{~mol}$
$\left[\mathrm{Au}(\mathrm{CN})_{2}\right]^{-}$will not be reduced.
Concentration of $\left[\mathrm{Au}(\mathrm{CN})_{2}\right]^{-}$when reaction has ceased $=0.010 \times 3=0.030 \mathrm{M}$
Concentration of $\left[\mathrm{Ag}(\mathrm{CN})_{2}\right]^{-}$when reaction has ceased $=0.3 \times(3 / 500)=0.002 \mathrm{M}$

$$
\begin{array}{ll}
{\left[\mathrm{Zn}(\mathrm{CN})_{4}\right]^{2-}+2 \mathrm{e}^{-} \rightarrow \mathrm{Zn}+4 \mathrm{CN}^{-}} & E^{0}=-1.26 \mathrm{~V} \\
{\left[\mathrm{Au}(\mathrm{CN})_{2}\right]^{\prime \prime}+\mathrm{e}^{-} \rightarrow \mathrm{Au}+2 \mathrm{CN} \sim} & E^{0}=-0.60 \mathrm{~V} \\
{\left[\mathrm{Ag}(\mathrm{CN})_{2}\right]^{\prime \prime}+\mathrm{e}^{-} \rightarrow \mathrm{Ag}+2 \mathrm{CN}-} & E^{0}=-0.31 \mathrm{~V}
\end{array}
$$

5.3 $\mathrm{Au}^{+}+2 \mathrm{CN}^{-} \rightarrow\left[\mathrm{Au}(\mathrm{CN})_{2}\right]^{-} \quad K_{f}=4 \times 10^{28}$
$99 \mathrm{~mol} \%\left[\mathrm{Au}(\mathrm{CN})_{2}\right]^{-}$
$K_{f}=\frac{\left[\mathrm{Au}(\mathrm{CN})_{2}^{-}\right]}{\left[\mathrm{Au}^{+}\right]\left[\mathrm{CN}^{-}\right]^{2}}$
$\frac{\left[\mathrm{Au}(\mathrm{CN})_{2}^{-}\right]}{\left[\mathrm{Au}^{+}\right]+\left[\mathrm{Au}(\mathrm{CN})_{2}^{-}\right]}=99 / 100$
Thus: $100 \times\left[\mathrm{Au}(\mathrm{CN})_{2}\right]=99 \times\left[\mathrm{Au}^{+}\right]+99 \times\left[\mathrm{Au}(\mathrm{CN})_{2}^{-}\right]$
Therefore $\left[\mathrm{Au}^{+}\right]=\left[\mathrm{Au}(\mathrm{CN})_{2}^{-}\right] / 99$

Substituting into $K_{f}$ :
$4 \times 10^{28}=99 /[\mathrm{CN}]^{2}$
$[\mathrm{CN}]=5 \times 10^{-14}$
5.4 Sodium cyanide escapes into ground water and produces hydrogen cyanide which is toxic to many animals.

## PROBLEM 2

## PART A

A diprotic acid, $\mathrm{H}_{2} \mathrm{~A}$, undergoes the following dissociation reactions :

$$
\begin{array}{ll}
\mathrm{H}_{2} \mathrm{~A} \rightleftharpoons \mathrm{HA}^{-}+\mathrm{H}^{+} ; & K_{1}=4.50 \times 10^{-7} \\
\mathrm{HA}^{-} \rightleftharpoons \mathrm{A}^{2-}+\mathrm{H}^{+} ; & K_{2}=4.70 \times 10^{-11}
\end{array}
$$

A $20.00 \mathrm{~cm}^{3}$ aliquot of a solution containing a mixture of $\mathrm{Na}_{2} \mathrm{~A}$ and NaHA is titrated with 0.300 M hydrochloric acid. The progress of the titration is followed with a glass electrode pH meter. Two points on the titration curve are as follows :

| $\mathrm{cm}^{3} \mathrm{HCl}$ added | pH |
| :---: | ---: |
| 1.00 | 10.33 |
| 10.00 | 8.34 |

2.1 On adding $1.00 \mathrm{~cm}^{3}$ of HCl , which species reacts first and what would be the product?
2.2 What is the amount ( mmol ) of the product formed in (2.1)?
2.3 Write down the main equilibrium of the product from (2.1) reacting with the solvent?
2.4 What are the amounts ( mmol ) of $\mathrm{Na}_{2} \mathrm{~A}$ and NaHA initially present?
2.5 Calculate the total volume of HCl required to reach the second equivalence point.

## PART B

Solutions I, II and III contain a pH indicator $\mathrm{HIn}\left(K_{\text {In }}=4.19 \times 10^{-4}\right)$ and other reagents as indicated in the table. The absorbance values at 400 nm of the solutions measured in the same cell, are also given in the table. $K_{a}$ of $\mathrm{CH}_{3} \mathrm{COOH}$ is $1.75 \times 10^{-5}$.

Table:

|  | Solution I | Solution II | Solution III |
| :--- | :--- | :--- | :--- |
| Total concentration |  |  |  |
| of indicator HIn | $1.00 \times 10^{-5} \mathrm{M}$ | $1.00 \times 10^{-5} \mathrm{M}$ | $1.00 \times 10^{-5} \mathrm{M}$ |
| Other reagents | 1.00 M HCl | 0.100 M NaOH | $1.00 \mathrm{M} \mathrm{CH}_{3} \mathrm{COOH}$ |
| Absorbance at 400 | 0.000 | 0.300 | $?$ |

2.6 Calculate the absorbance at 400 nm of solution III.
2.7 Apart from $\mathrm{H}_{2} \mathrm{O}, \mathrm{H}^{+}$and $\mathrm{OH}^{-}$, what are all the chemical species present in the solution resulting from mixing solution II and solution III at $1: 1$ volume ratio?
2.8 What is the absorbance at 400 nm of the solution in (2.7)?
2.9 What is the transmittance at 400 nm of the solution in (2.7)?

## SOLUTION

## PART A

2.1 Species which reacts first is $A^{2-}$.

The product is $\mathrm{HA}^{-}$.
$2.2 n($ product $)=1.00 \times 0.300=0.300 \mathrm{mmol}$
$2.3 \mathrm{HA}^{-}+\mathrm{H}_{2} \mathrm{O} \rightleftharpoons \mathrm{H}_{2} \mathrm{~A}+\mathrm{OH}^{-}$
2.4 At $p H 8.34$ which is equal to $\left(p K_{a 1}+p K_{a 2}\right) / 2$ all $\mathrm{A}^{-}$are protonated as $\mathrm{HA}^{-}$. Therefore $n\left(\mathrm{~A}^{2-}\right)$ initially present in the solution $=0.300 \times 10.00=3.00 \mathrm{mmol}$ At $p H=10.33$, the system is a buffer in which the ratio of $\left[A^{2-}\right]$ and $[H A]$ is equal to 1.

Thus
$[\mathrm{HA}]_{\text {initial }}+[\mathrm{HA}]_{\text {formed }}=\left[\mathrm{A}^{2}\right]_{\text {jnitial }}-[\mathrm{HA}]_{\text {formed }}$
$n\left(\mathrm{HA}^{-}\right)_{\text {initial }}=3.00-0.300-0.300 \mathrm{mmol}=2.40 \mathrm{mmol}$
$n\left(\mathrm{Na}_{2} \mathrm{~A}\right)=\underline{3.00 \mathrm{mmol}}$
$n(\mathrm{NaHA})=\underline{2.40 \mathrm{mmol}}$
2.5 Total volume of HCl required $=[(2 \times 3.00)+2.40] / 0.300=28.00 \mathrm{~cm}^{3}$

## PART B

2.6 Solution III is the indicator solution at $1 \times 10^{-5} \mathrm{M}$ in a solution containing 1.0 M $\mathrm{CH}_{3} \mathrm{COOH}$.

To obtain the absorbance of the solution, it is necessary to calculate the concentration of the basic form of the indicator which is dependent on the $\left[\mathrm{H}^{+}\right]$of the solution.
$\left[\mathrm{H}^{+}\right]$of solution III $=\sqrt{K_{a} c}=\sqrt{1.75 \times 10^{-5} \times 1.0}=4.18 \times 10^{-3}$
$K_{\mathrm{ln}}=\frac{\left[\mathrm{H}^{+}\right]\left[\mathrm{In}^{-}\right]}{[\mathrm{HIn}]}$
$\frac{\left[\ln ^{-}\right]}{[\mathrm{HIn}]}=\frac{K_{\text {ln }}}{\left[\mathrm{H}^{+}\right]}=\frac{1 \times 10^{-3.38}}{1 \times 10^{-2.38}}=0.100$
Since $\quad[\mathrm{HIn}]+\left[\mathrm{In}^{-}\right]=1 \times 10^{-5}$

$$
\begin{aligned}
10[\ln ]+[\ln ] & =1 \times 10^{-5} \\
{[\ln ] } & =0.091 \times 10^{-5}
\end{aligned}
$$

Absorbance of solution III $=\frac{0.091 \times 10^{-5}}{1.00 \times 10^{-5}} \times 0.300=0.027$
2.7 All the chemical species present in the solution resulting from mixing solution II and solution III at $1: 1$ volume ratio (apart from $\mathrm{H}^{+}, \mathrm{OH}^{-}$and $\mathrm{H}_{2} \mathrm{O}$ ) are the following:
$\mathrm{CH}_{3} \mathrm{COOH}, \mathrm{CH}_{3} \mathrm{COO}^{-}, \mathrm{Na}^{+}$, $\mathrm{HIn}, \mathrm{In}^{-}$.
2.8 When solutions II and III are mixed at 1:1 volume ratio, a buffer solution of 0.05 M $\mathrm{CH}_{3} \mathrm{COO}^{-} / 0.45 \mathrm{M} \mathrm{CH}_{3} \mathrm{COOH}$ is obtained.
$\left[\mathrm{H}^{+}\right]$of the mixture solution $=K_{\mathrm{a}} \frac{\left[\mathrm{CH}_{3} \mathrm{COOH}\right]}{\left[\mathrm{CH}_{3} \mathrm{COO}^{-}\right]}=1.75 \times 10^{-5} \times \frac{0.45}{0.05}=15.75 \times 10^{-5}$
$\frac{\left[\mathrm{ln}^{-}\right]}{[\mathrm{HIn}]}=\frac{K_{\mathrm{In}}}{\left[\mathrm{H}^{+}\right]}=\frac{1 \times 10^{-3.38}}{15.75 \times 10^{-5}}=2.65$

Since

$$
\begin{aligned}
{[\mathrm{HIn}]+[\mathrm{ln}] } & =1 \times 10^{-5} \\
\frac{[\mathrm{ln}]}{2.65}+[\mathrm{ln}] & =1 \times 10^{-5} \\
{[\mathrm{ln}] } & =0.726 \times 10^{-5}
\end{aligned}
$$

Absorbance of solution $=\frac{0.726 \times 10^{-5}}{1.00 \times 10^{-5}} \times 0.300=0.218$
2-9 Transmittance of solution $=10^{-0.218}=0.605 \Rightarrow 60.5 \%$

## PROBLEM 6

## Hard Water

In Denmark the subsoil consists mainly of limestone. In contact with ground water containing carbon dioxide some of the calcium carbonate dissolves as calcium hydrogen carbonate. As a result, such ground water is hard, and when used as tap water the high content of calcium hydrogen carbonate causes problems due to precipitation of calcium carbonate in, for example, kitchen and bathroom environments.

Carbon dioxide, $\mathrm{CO}_{2}$, is a diprotic acid in aqueous solution. The $\mathrm{p} K_{\mathrm{a}}$-values at $0{ }^{\circ} \mathrm{C}$ are:

$$
\begin{array}{ll}
\mathrm{CO}_{2}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l}) \rightleftharpoons \mathrm{HCO}_{3}^{-}(\mathrm{aq})+\mathrm{H}^{+}(\mathrm{aq}) & \mathrm{p} K_{\mathrm{a} 1}=6.630 \\
\mathrm{HCO}_{3}^{-}(\mathrm{aq}) \rightleftharpoons \mathrm{CO}_{3}^{2-}(\mathrm{aq})+\mathrm{H}^{+}(\mathrm{aq}) & \mathrm{p} K_{\mathrm{a} 2}=10.640
\end{array}
$$

The liquid volume change associated with dissolution of $\mathrm{CO}_{2}$ may be neglected for all of the following problems. The temperature is to be taken as being $0^{\circ} \mathrm{C}$.
6.1 The total concentration of carbon dioxide in water which is saturated with carbon dioxide at a carbon dioxide partial pressure of 1.00 bar is $0.0752 \mathrm{~mol} \mathrm{dm}^{-3}$. Calculate the volume of carbon dioxide gas which can be dissolved in one litre of water under these conditions.
The gas constant $\quad R=8.314 \mathrm{~J} \mathrm{~mol}^{-1} \mathrm{~K}^{-1}=0.08314 \mathrm{~L}^{2}$ bar mol${ }^{-1} \mathrm{~K}^{-1}$
6.2 Calculate the equilibrium concentration of hydrogen ions and the equilibrium concentration of $\mathrm{CO}_{2}$ in water saturated with carbon dioxide at a carbon dioxide partial pressure of 1.00 bar.
6.3 Calculate the equilibrium concentration of hydrogen ions in a 0.0100 m aqueous solution of sodium hydrogen carbonate saturated with carbon dioxide at a carbon dioxide partial pressure of 1.00 bar.
6.4 Calculate the equilibrium concentration of hydrogen ions in a 0.0100 m aqueous solution of sodium carbonate saturated with carbon dioxide at a carbon dioxide partial pressure of 1.00 bar. Ignore water dissociation effects.
6.5 The solubility of calcium carbonate in water at $0^{\circ} \mathrm{C}$ is 0.0012 g per 100 cm 3 of water. Calculate the concentration of calcium ions in a saturated solution of calcium carbonate in water.

The hard groundwater in Denmark is formed via contact of water with limestone in the subsoil which reacts with carbon dioxide dissolved in the groundwater according to the equilibrium equation:

$$
\mathrm{CaCO}_{3}(\mathrm{~s})+\mathrm{CO}_{2}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{I}) \rightleftharpoons \mathrm{Ca}^{2+}(\mathrm{aq})+2 \mathrm{HCO}_{3}^{-}(\mathrm{aq})
$$

The equilibrium constant, $K$, for this reaction is $10^{-4.25}$ at $0^{\circ} \mathrm{C}$.
6.6 Calculate the concentration of calcium ions in water in equilibrium with calcium carbonate in an atmosphere with a partial pressure of carbon dioxide of 1.00 bar .
6.7 A 0.0150 m solution of calcium hydroxide is saturated with carbon dioxide gas at a partial pressure of 1.00 bar. Calculate the concentration of calcium ions in the solution by considering the equilibrium equation given above in connection with problem 6.6.
6.8 The calcium hydroxide solution referred to in problem 6.7 is diluted to twice the volume with water before saturation with carbon dioxide gas at a partial pressure of 1.00 bar. Calculate the concentration of calcium ions in the resulting solution saturated with $\mathrm{CO}_{2}$.
6.9 Calculate the solubility product constant for calcium carbonate from the data given above.

## SOLUTION

$6.1 \mathrm{c}\left(\mathrm{CO}_{2}\right)=0.0752 \mathrm{M} \quad n\left(\mathrm{CO}_{2}\right)=0.0752 \mathrm{~mol}$
The ideal gas equation: $\quad p V=n R T$
1.00 bar $\times V=0.0752 \mathrm{~mol} \times 0.08314 \mathrm{dm}^{3} \mathrm{bar} \mathrm{mol}^{-1} \mathrm{~K}^{-1} \times 273.15 \mathrm{~K}$
$V=1.71 \mathrm{dm}^{3}$
$6.2 \mathrm{CO}_{2}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{I}) \rightarrow \mathrm{HCO}_{3}^{-}(\mathrm{aq})+\mathrm{H}^{+}(\mathrm{aq})$
$\left[\mathrm{H}^{+}\right]=\left[\mathrm{HCO}_{3}^{-}\right]=\mathrm{x}$ and $\left[\mathrm{CO}_{2}\right]+\left[\mathrm{HCO}_{3}^{-}\right]=0.0752$
$K_{a}=10^{-6.63}=\frac{\left[\mathrm{H}^{+}\right]\left[\mathrm{HCO}_{3}^{-}\right]}{\left[\mathrm{CO}_{2}\right]}=\frac{\mathrm{x}^{2}}{0.0752-\mathrm{x}}$
$\left[\mathrm{H}^{+}\right]=0.000133 \quad$ and $\quad\left[\mathrm{CO}_{2}\right]=0.0751$
$6.3 \mathrm{CO}_{2}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{I}) \rightarrow \mathrm{HCO}_{3}^{-}(\mathrm{aq})+\mathrm{H}^{+}(\mathrm{aq})$
$\left[\mathrm{CO}_{2}\right]=0.0751$ and $\left[\mathrm{HCO}_{3}^{-}\right]=0.0100$
$K_{\mathrm{a}}=10^{-6.63}=\frac{\left[\mathrm{H}^{+}\right]\left[\mathrm{HCO}_{3}^{-}\right]}{\left[\mathrm{CO}_{2}\right]}=\frac{x 0.0100}{0.0751}$
$\mathrm{X}=\left[\mathrm{H}^{+}\right]=1.76 \times 10^{-6}$
$6.4 \mathrm{CO}_{2}(\mathrm{aq})+\mathrm{CO}_{3}^{2-}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{I}) \rightarrow 2 \mathrm{HCO}_{3}^{-}(\mathrm{aq}) \quad\left[\mathrm{HCO}_{3}^{-}\right]=0.0200$
$\mathrm{CO}_{2}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{I}) \rightarrow \mathrm{HCO}_{3}^{-}(\mathrm{aq})+\mathrm{H}^{+}(\mathrm{aq})$
$K_{a}=10^{-6.63}=\frac{\left[\mathrm{H}^{+}\right]\left[\mathrm{HCO}_{3}^{-}\right]}{\left[\mathrm{CO}_{2}\right]}=\frac{\mathrm{x} 0.0200}{0.0751}$
$\mathrm{x}=\left[\mathrm{H}^{+}\right]=8.8 \times 10^{-7}$
$6.5 \quad 0.0012 \mathrm{~g} \mathrm{CaCO}_{3}$ in $100 \mathrm{~cm}^{3}$ of water
$0.0012 \mathrm{~g}^{2} 100 \times 0872 \mathrm{~g} \mathrm{~mol}^{-1}=0.000012 \mathrm{~mol} \mathrm{CaCO}_{3}$ in $100 \mathrm{~cm}^{3}$ of water
$\left[\mathrm{Ca}^{2+}\right]=1.2 \times 10^{-4} \quad c\left(\mathrm{Ca}^{2+}\right)=1.2 \times 10^{-4} \mathrm{~mol} \mathrm{dm}^{-3}$
$6.6 K=\frac{\left[\mathrm{Ca}^{2+}\right]\left[\mathrm{HCO}_{3}^{-}\right]}{\left[\mathrm{CO}_{2}\right]}=10^{-4.25}$ and $2\left[\mathrm{Ca}^{2+}\right]=\left[\mathrm{HCO}_{3}^{-}\right]$
$\frac{4\left[\mathrm{Ca}^{2+}\right]}{0.0751}=10^{-4.25} \quad\left[\mathrm{Ca}^{2+}\right]=1.02 \times 10^{-2} \quad c\left(\mathrm{Ca}^{2+}\right)=1.02 \times 10^{-2} \mathrm{~mol} \mathrm{dm}^{-3}$
$6.7 c\left(\mathrm{Ca}(\mathrm{OH})_{2}\right)=0.015 \mathrm{~mol} \mathrm{dm}^{-3}$
$\mathrm{OH}^{-}(\mathrm{aq})+\mathrm{CO}_{2}(\mathrm{aq}) \rightarrow \mathrm{HCO}_{3}^{-}(\mathrm{aq})$
All hydroxide has been consumed ( $K=10^{7.37}$ ).
From problem 6.6 we found that the maximum possible calcium ion concentration is smaller, i.e. precipitation of $\mathrm{CaCO}_{3}$
$\left[\mathrm{Ca}^{2+}\right]=1.02 \times 10^{-2} \quad c\left(\mathrm{Ca}^{2+}\right)=1.02 \times 10^{-2} \mathrm{~mol} \mathrm{dm}^{-3}$
$6.8 c\left(\mathrm{Ca}(\mathrm{OH})_{2}\right)=0.0075 \mathrm{~mol} \mathrm{dm}^{-3}$
From problem 6.6 we found that the maximum possible calcium ion concentration we can have, is $1.02 \times 10^{-2} \mathrm{~mol} \mathrm{dm}^{-3}$, i.e. no precipitation of $\mathrm{CaCO}_{3}$ occurs.

$$
\left[\mathrm{Ca}^{2+}\right]=0.75 \times 10^{-2} \quad c\left(\mathrm{Ca}^{2+}\right)=0.75 \times 10^{-2} \mathrm{~mol} \mathrm{dm}^{-3}
$$

## 6.9

$$
\begin{aligned}
& K=\frac{\left[\mathrm{Ca}^{2+}\right]\left[\mathrm{HCO}_{3}^{-}\right]}{\left[\mathrm{CO}_{2}\right]}=\frac{\left[\mathrm{Ca}^{2+}\right]\left[\mathrm{HCO}_{3}^{-}\right]}{\left[\mathrm{CO}_{2}\right]} \times \frac{\left[\mathrm{CO}_{3}^{2-}\right]\left[\mathrm{H}^{+}\right]}{\left[\mathrm{CO}_{3}^{2-}\right]\left[\mathrm{H}^{+}\right]}=\frac{K_{s p} K_{\mathrm{a} 1}}{K_{\mathrm{a} 2}} \\
& K_{\text {sp }}=10^{-8.26}
\end{aligned}
$$

## PROBLEM 2

## Phosphoric Acid

Phosphoric acid is of a great importance in fertilizer industry. Besides, phosphoric acid and its various salts have a n umber of applications in metal treatment, food, detergent and toothpaste industries.
2.1 The pK values of the three successive dissociations of phosphoric acid at $25^{\circ} \mathrm{C}$ are:

$$
\begin{aligned}
& p K_{1 \mathrm{a}}=2.12 \\
& p K_{2 \mathrm{a}}=7.21 \\
& p K_{3 \mathrm{a}}=12.32
\end{aligned}
$$

Write down the conjugate base of dihydrogen phosphate ion and determine its $p K_{b}$ value.

Small quantities of phosphoric acid are extensively used to impart the sour or tart taste to many soft drinks such as colas and root beers. A cola having a density of 1.00 $\mathrm{g} \mathrm{cm}^{-3}$ contains $0.05 \%$ by weight of phosphoric acid.
2.2 Determine the pH of the cola (ignoring the second and the third dissociation steps for phosphoric acid). Assume that the acidity of the cola arises only from phosphoric acid.
2.3 Phosphoric acid is used as a fertiliser for agriculture. $1.00 \times 10^{-3} \mathrm{M}$ phosphoric acid is added to an aqueous soil suspension and the pH is found to be 7.00 .

Determine the fractional concentrations of all the different phosphate species present in the solution. Assume that no component of the soil interacts with any phosphate species.
2.4 Zinc is an essential micronutrient for plant growth. Plant can absorb zinc in water soluble form only. In a given soil water with $\mathrm{pH}=7.0$, zinc phosphate was found to be the only source of zinc and phosphate. Calculate the concentration of $\left[\mathrm{Zn}^{2+}\right]$ and $\left[\mathrm{PO}_{4}^{3-}\right]$ ions in the solution. Ksp for zinc phosphate is $9.1 \times 10^{-33}$.

## SOLUTION

2.1 The conjugate base of dihydrogen phosphate $\left(\mathrm{H}_{2} \mathrm{PO}_{4}^{-}\right)$is monohydrogen phosphate $\left(\mathrm{HPO}_{4}^{2-}\right):$
$\mathrm{H}_{2} \mathrm{PO}_{4}^{-}+\mathrm{H}_{2} \mathrm{O} \rightleftharpoons \mathrm{HPO}_{4}^{2-}+\mathrm{H}_{3} \mathrm{O}^{+} \quad \mathrm{K}_{2 \mathrm{a}}$
$\mathrm{HPO}_{4}^{2-}+\mathrm{H}_{2} \mathrm{O} \rightleftharpoons \mathrm{H}_{2} \mathrm{PO}_{4}^{-}+\mathrm{OH}^{-} \quad K_{2 b}$
$2 \mathrm{H}_{2} \mathrm{O} \rightleftharpoons \mathrm{H}_{3} \mathrm{O}^{+}+\mathrm{OH}^{-} \quad K_{\mathrm{w}}$
$p K_{2 \mathrm{a}}+p K_{2 \mathrm{~b}}=p K_{w}=14$
$p K_{2 b}=6.79$
2.2 Concentration of $\mathrm{H}_{3} \mathrm{PO}_{4}=\frac{0.5}{98}=0.0051 \mathrm{M}$
$\mathrm{H}_{3} \mathrm{PO}_{4}+\mathrm{H}_{2} \mathrm{O} \rightleftharpoons \mathrm{H}_{2} \mathrm{PO}_{4}^{-}+\mathrm{H}_{3} \mathrm{O}^{+}$
0.0051-x $x+x$
$p K_{1 \mathrm{a}}=2.12$ gives $K_{1 \mathrm{a}}=7.59 \times 10^{-3}$
$7.59 \times 10^{-3}=\frac{\left[\mathrm{H}_{2} \mathrm{PO}_{4}^{-}\right]\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]}{\left[\mathrm{H}_{3} \mathrm{PO}_{4}\right]}=\frac{\mathrm{x}^{2}}{0.0051-\mathrm{x}}$
$x=\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=3.49 \times 10^{-3}$
$\mathrm{pH}=2.46$
2.3 Let $f_{0}=\frac{\left[\mathrm{H}_{3} \mathrm{X}\right]}{C}, \quad f_{1}=\frac{\left[\mathrm{H}_{2} \mathrm{X}^{-}\right]}{C}$,
$f_{2}=\frac{\left[\mathrm{HX}^{2-}\right]}{C}$ and $f_{3}=\frac{\left[\mathrm{X}^{3-}\right]}{C}$
denote the fractional concentrations of different phosphate species. C is the total initial concentration of $\mathrm{H}_{3} \mathrm{X}$. $\left(\mathrm{X}=\mathrm{PO}_{4}\right)$

$$
\begin{aligned}
& f_{0}+f_{1}+f_{2}+f_{3}=1 \\
& K_{1 a}=\frac{\left[\mathrm{H}_{2} \mathrm{X}^{-}\right]\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]}{\left[\mathrm{H}_{3} \mathrm{X}\right]}=\frac{f_{1}}{f_{0}}\left[\mathrm{H}_{3} \mathrm{O}^{+}\right] \\
& K_{2 a}=\frac{\left[\mathrm{HX}^{2-}\right]\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]}{\left[\mathrm{H}_{2} \mathrm{X}^{-}\right]}=\frac{f_{2}}{f_{1}}\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]
\end{aligned}
$$

$$
K_{3 a}=\frac{\left[\mathrm{X}^{3-}\right]\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]}{\left[\mathrm{HX}^{2-}\right]}=\frac{f_{3}}{f_{2}}\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]
$$

These equations lead to
$f_{0}=\frac{\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]^{3}}{\mathrm{D}}, \quad f_{1}=\frac{K_{1 \mathrm{a}}\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]^{2}}{\mathrm{D}}, \quad f_{2}=\frac{K_{1 \mathrm{a}} K_{2 \mathrm{a}}\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]}{\mathrm{D}}, \quad f_{3}=\frac{K_{1 \mathrm{a}} K_{2 \mathrm{a}} K_{3 \mathrm{a}}}{\mathrm{D}}$
where $\mathrm{D}=K_{1 \mathrm{a}} K_{2 \mathrm{a}} K_{3 \mathrm{a}}+K_{1 \mathrm{a}} K_{2 \mathrm{a}}\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]+K_{1 \mathrm{a}}\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]^{2}+\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]^{3}$

From the values of $p K_{1 a}, p K_{2 a}, p K_{3 a}$ and $p H$ one gets
$K_{1 \mathrm{a}}=7.59 \times 10^{-3} ; \quad K_{2 \mathrm{a}}=6.17 \times 10^{-8} ; K_{3 \mathrm{a}}=4.79 \times 10^{-13} ; \quad\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=1 \times 10^{-7}$
The fractional concentrations of different phosphate species are:
$\mathrm{H}_{3} \mathrm{PO}_{4} \quad\left(f_{0}\right)=8.10 \times 10^{-6}$
$\mathrm{H}_{2} \mathrm{PO}_{4}^{-}\left(f_{1}\right)=0.618$
$\mathrm{HPO}_{4}^{2-} \quad\left(f_{2}\right)=0.382$
$\mathrm{PO}_{4}^{3-} \quad\left(f_{3}\right)=1.83 \times 10^{-6}$
2.4 Let $S\left(\mathrm{~mol} \mathrm{dm}^{-3}\right)$ be the solubility of $\mathrm{Zn}_{3}\left(\mathrm{PO}_{4}\right)_{2}$ in soil water.
$\left[\mathrm{Zn}^{2+}\right]=3 S$
Total concentration of different phosphate species $=2 S$
$\left[\mathrm{PO}_{4}^{3-}\right]=f_{3} \times 2 S$
$f_{3}$ can be determined from the relation derived in 2.3
For $p H=7, \quad f_{3}=1.83 \times 10^{-6}$
$K_{s p}=\left[\mathrm{Zn}^{2+}\right]^{3}\left[\mathrm{PO}_{4}^{3-}\right]^{2}$
$9.1 \times 10^{-33}=(3 S)^{3}\left(f_{3} \times 2 S\right)^{2}$
$\left[\mathrm{Zn}^{2+}\right]=9 \times 10^{-5}$
$\left[\mathrm{PO}_{4}{ }^{3-}\right]=1.1 \times 10^{-10}$
Solubility of $\mathrm{Zn}_{3}\left(\mathrm{PO}_{4}\right)_{2}=3.0 \times 10^{-5} \mathrm{~mol} \mathrm{dm}^{-3}$

## PROBLEM 2

## Nitrogen Cycle in Nature

Ammonia is a toxic substance to marine animals at levels exceeding 1 ppm. Nitrifying bacteria play an important role in the conversion of $\mathrm{NH}_{3}$ first to nitrite and then to nitrate, the storage form of nitrogen in the soil.

$$
\mathrm{NH}_{3}+2 \mathrm{O}_{2}+\mathrm{NADH} \xrightarrow[\text { bacteria }]{\text { Nitrosomonas }} \mathrm{NO}_{2}^{-}+2 \mathrm{H}_{2} \mathrm{O}+\mathrm{NAD}
$$

NADH is the biochemical reducing agent of the coenzyme nicotinamide dinucleotide (NAD), $\mathrm{NAD}^{+}$is the oxidized form of the coenzyme NAD.

$$
2 \mathrm{NO}_{2}^{-}+\mathrm{O}_{2} \xrightarrow[\text { Ditrobacter }]{\longrightarrow} 2 \mathrm{NO}_{3}^{-}
$$

2.1 Give the oxidation states of N in the following series: (Use the boxes below the compounds)

The spectrophotometric analysis of nitrite is based on a reaction with an indicator. The coloured product then obtained has an absorbance maximum at $\lambda=543 \mathrm{~nm}$. For quantitative analyses a calibration curve has to be made, in which absorbance at the maximum absorbance wavelength $\lambda=543 \mathrm{~nm}$ is plotted against nitrite concentration in a series of standards.
2.2 The measurements are performed at the wavelength with the maximum absorbance because:
$\square$ There is no interference of impurities.
$\square$ There is no contribution of stray light.
$\square$ There is optimal accuracy of the measurement.
$\square$ None of these statements.
Mark the correct answer.

The absorption is measured with a single beam spectrophotometer. However $5 \%$ of the light, the so-called stray light $I_{\mathrm{s}}$, strikes the detector directly (see Figure 2).

Figure 2
2.3 Calculate the value of the absorbance $A$ shown by the spectrophotometer if $\varepsilon=6$ $000 \mathrm{M}^{-1} \mathrm{~cm}^{-1}, I=1 \mathrm{~cm}$ and $c=1 \times 10^{-4} \mathrm{M}$

For a nitrite determination in water the following data have been measured.
Table 1

| concentration of nitrite nitrogen (ppm) | absorbance at $543 \mathrm{~nm}(1.000 \mathrm{~cm}$ cell) |
| :---: | :---: |
| blank | 0.003 (due to impurities in the solvent) |
| 0.915 | 0.167 |
| 1.830 | 0.328 |

2.4 Determine (show calculation) from the data given above, using the values corrected for the solvent impurities, the slope $m$ and the intercept $b$ of the calibration curve $A=m c+b$.

The duplicate analyses of a water sample are given below. The measurements have been performed at a wavelength of 543 nm and in a 2.000 cm cell.

## Table 2

| water sample | absorbance |
| :--- | :--- |
| analysis 1 | 0.562 |
| analysis 2 | 0.554 |

For the calculation of the concentration of the nitrite nitrogen ( $c$ in ppm) the equation obtained by the method of least squares
corrected absorbance $=0.1769 c+0.0015$
may be applied, using the measurements in a 1.000 cm cell.
2.5 Calculate the average nitrite nitrogen concentration in ppm and $\mu \mathrm{g} \mathrm{cm}^{-3}$. Hint: Take the blank from problem 2.4.

## SOLUTION

$2.1 \mathrm{NH}_{3}$ : -III (-3)
$\mathrm{NO}_{2}$ : III (3)
$\mathrm{NO}_{3}^{-}: \mathrm{V}(5)$
2.2 Correct answer: There is optimal accuracy of the measurement.
$2.3 \quad I_{S}=0.05 \times I_{0} \quad A=\log \frac{I_{0}}{I+I_{S}} \quad$ (see Figure 2)
The absorption of the solution $A_{\text {sol }}$ is given by the relation:
$A_{\text {sol }}=\log 0.95 \times \frac{l_{0}}{l}=\varepsilon c d$
$I=0.95 \times I_{0} \times 10^{-6000 \cdot 0.0001 \cdot 1}=0.95 I_{0} \times 10^{-0.6}$
$A=\log \frac{I_{0}}{0.95 \times I_{0} \times 10^{-0.6}+0.05 \times I_{0}}=0.54$
2.4 The absorbance of the blank solution (see Table): $A=0.003$.

Slope $m$ of the calibration curve:
$m=\frac{\Delta A}{\Delta c}=\frac{A_{2}-A_{1}}{c_{2}-c_{1}}=\frac{0.325-0.164}{1.830-0.915}=\frac{0.161}{0.915 \mathrm{M}}=0.176 \mathrm{M}^{-1}$
Note: Corrected absorbance values were used in the calculation.
$A=0.176 c+b$
For $c=0, A=0.003$.
Thus: $b=0.003$
2.5 The average absorption in a 2 cm cell is 0.558 ; thus, in a 1 cm cell is 0.279 . Regarding the blank value ( 0.003 ) the corrected absorption has the value 0.276 . Substituting this value into the equation (a) gives:

$$
c=\frac{0.276-0.0015}{0.1769} \mathrm{ppm}
$$

$$
c=1.55 \mathrm{ppm}=1.55 \mu \mathrm{~g} \mathrm{~cm}^{-3}
$$

## PROBLEM 8

## Colloids

The combination of an inorganic and an organic component on a nanometer scale yields materials with excellent properties. Thus the synthesis of hybrid nanoparticles is of interest.
( $T=298.15 \mathrm{~K}$ throughout whole problem)
Solution $\mathbf{A}$ is an aqueous solution of $\mathrm{CaCl}_{2}$ with a concentration of $1.780 \mathrm{~g} \mathrm{dm}^{-3}$. Solution $\mathbf{B}$ is an aqueous solution of $\mathrm{Na}_{2} \mathrm{CO}_{3}$ with a concentration of $1.700 \mathrm{~g} \mathrm{dm}^{-3}$.
$p K_{a 1}\left(\mathrm{H}_{2} \mathrm{CO}_{3}\right)=6.37 \quad p K_{a 2}\left(\mathrm{HCO}_{3}{ }^{-}\right)=10.33$
8.1 Calculate the pH of solution $\mathbf{B}$ using reasonable assumptions.
$100 \mathrm{~cm}^{3}$ of solution A and $100 \mathrm{~cm}^{3}$ of solution B are mixed to form solution C. Solution $\mathbf{C}$ is adjusted to pH 10 . A precipitate forms.

$$
K_{s p}\left(\mathrm{Ca}(\mathrm{OH})_{2}\right)=6.46 \times 10^{-6} \quad K_{s p}\left(\mathrm{CaCO}_{3}\right)=3.31 \times 10^{-9}
$$

8.2 Show by calculation for each of the compounds $\mathrm{Ca}(\mathrm{OH})_{2}$ and $\mathrm{CaCO}_{3}$ whether it can be found in the precipitate or not.

In a similar experiment $100 \mathrm{~cm}^{3}$ of solution A additionally contain 2 g of a copolymer consisting of two water soluble blocks: a poly(ethylene oxide) block and a poly(acrylic acid) block:

The polymer does not undergo any chemical reaction (except protolysis of the acid) and yet has a strong effect: after mixing of the two solutions $(\mathbf{A}+\mathbf{B})$ no precipitate can be observed. Small calcium carbonate particles with the polymer chains attached to their surface form. The attached polymers prevent further crystal growth and the hybrid particles remain in solution.
8.3 Circle the block of the polymer (on the answer sheet) that attaches to the surface of the growing calcium carbonate crystal.

To characterize the hybrid particles they are separated from the preparation solution and transferred into $50 \mathrm{~cm}^{3}$ of an aqueous NaOH solution $\left(c(\mathrm{NaOH})=0.19 \mathrm{~mol} \mathrm{dm}^{-3}\right)$. The solution is diluted by the addition of $200 \mathrm{~cm}^{3}$ of water. Assume that the new solution contains only the hybrid particles and no additional calcium or carbonate ions. All acidic groups participate in the acid-base equilibrium.

- For the new solution, a pH of 12.30 is measured.
- In electron microscopy you only can see the inorganic particles (not the polymer): Spherical particles of 100 nm diameter are observed.
- The molar mass of the hybrid particles (inorganic and organic part together) is determined to be $M=8.01 \cdot 10^{8} \mathrm{~g} \mathrm{~mol}^{-1}$
- The charge of the particles is found to be $\mathrm{Z}=-800$ (number of unit charges).
$\left(p K_{a}(\mathrm{COOH}\right.$, copolymer $\left.)=4.88\right)$
8.4 How much of the initial amount of polymer ( 2 g ) can still be found in the hybrid particles?
8.5 Calculate which modification of calcium carbonate has been formed.

| Modification | density |
| :---: | :---: |
| Calcite | $2.71 \mathrm{~g} \mathrm{~cm}^{-3}$ |
| Vaterite | $2.54 \mathrm{~g} \mathrm{~cm}^{-3}$ |
| Aragonite | $2.95 \mathrm{~g} \mathrm{~cm}^{-3}$ |

## SOLUTION

8.1 pH of solution $\mathbf{B}$ :

$$
\begin{gathered}
K_{\mathrm{b} 2}=\frac{c\left(\mathrm{HCO}_{3}^{-}\right) /\left(1 \mathrm{~mol} \mathrm{dm}^{-3}\right) \times c\left(\mathrm{OH}^{-}\right) /\left(1 \mathrm{~mol} \mathrm{dm}^{-3}\right)}{c\left(\mathrm{CO}_{3}^{2-}\right) /\left(1 \mathrm{~mol} \mathrm{dm}^{-3}\right)} \quad K_{\mathrm{b} 2}=\frac{10^{-14}}{10^{-10.33}} \\
K_{\mathrm{b} 2}=2.14 \times 10^{-4}
\end{gathered}
$$

$K_{b 1}=2.34 \times 10^{-8}$
Since $K_{b 2} \gg K_{b 1}$, only one protonation step of the $\mathrm{CO}_{3}^{2-}$ has to be considered.
$c\left(\mathrm{HCO}_{3}^{-}\right)=c\left(\mathrm{OH}^{-}\right)=\mathrm{x} \quad$ and $\quad c\left(\mathrm{CO}_{3}^{2-}\right)=c_{0}\left(\mathrm{CO}_{3}^{2-}\right)-\mathrm{x}$
$c_{0}\left(\mathrm{Na}_{2} \mathrm{CO}_{3}\right)=\frac{1.700 \mathrm{~g} \mathrm{dm}^{-3}}{105.99 \mathrm{~g} \mathrm{~mol}^{-1}}$
$c_{0}\left(\mathrm{Na}_{2} \mathrm{CO}_{3}\right)=c_{0}\left(\mathrm{CO}_{3}^{2-}\right)=0.016 \mathrm{~mol} \mathrm{dm}^{-3}$
$K_{\mathrm{b} 2}=\frac{\mathrm{x}^{2} /\left(1 \mathrm{~mol} \mathrm{dm}^{-3}\right)}{\left(c_{0}\left(\mathrm{CO}_{3}^{2-}\right)-\mathrm{x}\right)} \quad \mathrm{x}=c\left(\mathrm{OH}^{-}\right)=1.75 \times 10^{-3} \mathrm{~mol} \mathrm{dm}^{-3}$
$p H=11.2$
8.2 $\mathrm{Ca}(\mathrm{OH})_{2}, \mathrm{CaCO}_{3}$ in the precipitate?
$M\left(\mathrm{CaCl}_{2}\right)=110.98 \mathrm{~g} \mathrm{~mol}^{-1}$
$p H=10, c\left(\mathrm{OH}^{-}\right)=1 \times 10^{-4} \mathrm{~mol} \mathrm{dm}^{-3}$
$\mathrm{C}_{0}\left(\mathrm{Na}_{2} \mathrm{CO}_{3}\right)=\frac{1.700 \mathrm{~g} \mathrm{~cm}^{-3}}{105.99 \mathrm{~g} \mathrm{~mol}^{-1} \times 2}$
$c\left(\mathrm{CaCl}_{2}\right)=\frac{1.780 \mathrm{~g} \mathrm{dm}^{-3}}{110.98 \mathrm{~g} \mathrm{~mol}^{-1} \times 2}$
$c_{0}\left(\mathrm{Na}_{2} \mathrm{CO}_{3}\right)=8.0 \times 10^{-3} \mathrm{~mol} \mathrm{dm}^{-3} \quad c\left(\mathrm{CaCl}_{2}\right)=c_{0}\left(\mathrm{Ca}^{2+}\right)=8.0 \times 10^{-3} \mathrm{~mol} \mathrm{dm}^{-3}$

Calculations for $\mathrm{Ca}(\mathrm{OH})_{2}$ :
$c\left(\mathrm{OH}^{-}\right)^{2} \times c_{0}\left(\mathrm{Ca}^{2+}\right)=8 \times 10^{-11}<6.46 \times 10^{-6}=K_{s p}\left(\mathrm{Ca}(\mathrm{OH})_{2}\right) \quad$ no precipitate

Calculations for $\mathrm{CaCO}_{3}$ :
$\mathrm{K}_{\mathrm{b} 2}=\frac{c\left(\mathrm{HCO}_{3}^{-}\right) \times c\left(\mathrm{OH}^{-}\right)}{c\left(\mathrm{CO}_{3}^{2-}\right)}, \quad c\left(\mathrm{HCO}_{3}^{-}\right)=\frac{K_{b 2}}{c\left(\mathrm{OH}^{-}\right)} \times c\left(\mathrm{CO}_{3}^{2-}\right)$
$\mathrm{c}\left(\mathrm{HCO}_{3}^{-}\right)=2.14 \times c\left(\mathrm{CO}_{3}^{2-}\right) \quad$ and $\quad c\left(\mathrm{HCO}_{3}^{-}\right)+c\left(\mathrm{CO}_{3}^{2-}\right)=c\left(\mathrm{Na}_{2} \mathrm{CO}_{3}\right)$
$2.14 \times c\left(\mathrm{CO}_{3}^{2-}\right)+c\left(\mathrm{CO}_{3}^{2-}\right)=8.0 \times 10^{-3} \mathrm{~mol} \mathrm{dm}^{-3}$

Initial concentration of $\mathrm{CO}_{3}^{2-}$ in solution C: $\quad c\left(\mathrm{CO}_{3}^{2-}\right)=2.55 \times 10^{-3} \mathrm{~mol} \mathrm{dm}^{-3}$

Initial concentration of $\mathrm{Ca}^{2+}$ in solution C: $\quad c\left(\mathrm{Ca}^{2+}\right)=8.0 \times 10^{-3} \mathrm{~mol} \mathrm{dm}^{-3}$
hence

$$
c\left(\mathrm{CO}_{3}^{2-}\right) \times c\left(\mathrm{Ca}^{2+}\right)=2.04 \times 10^{-5}>3.3 \times 10^{-9}=K_{s p}\left(\mathrm{CaCO}_{3}\right) \quad \text { precipitate }
$$

$\mathrm{Ca}(\mathrm{OH})_{2}$ will be found in the precipitate

| yes $\square$ | no 区 |
| :---: | :---: |
| yes 区 | no $\square$ |

8.3 Circle the block that attaches to the $\mathrm{CaCO}_{3}$ crystal:

Notes: Both polymer blocks are hydrophilic. The acrylic acid block will preferably bind to the crystal since it is more polarized and additionally charged. The polymer binds to the surface at positions where there is an excess of calcium ions on the surface of the ionic crystal.
8.4 How much of the initial amount of polymer ( 2 g ) can still be found in the hybrid particles?

$$
\mathrm{RCOOH}+\mathrm{OH}^{-} \rightleftarrows \mathrm{RCOO}^{-}+\mathrm{H}_{2} \mathrm{O} \quad p K_{b}=9.12
$$

$p H$ and $p K_{a}$ lead to the total concentration of COOH groups in the solution:

$$
\begin{array}{ll}
c\left(\mathrm{COO}^{-}\right)=\mathrm{x} & c(\mathrm{COOH})=c_{0}(\mathrm{COOH})-\mathrm{x}
\end{array} \mathrm{x=c}_{0}\left(\mathrm{OH}^{-}\right)-c\left(\mathrm{OH}^{-}\right) \begin{aligned}
& c_{0}\left(\mathrm{OH}^{-}\right)=\frac{50 \mathrm{~cm}^{3}}{250 \mathrm{~cm}^{3}} 0.19 \mathrm{~mol} \mathrm{dm}^{-3} \\
& c\left(\mathrm{OH}^{-}\right)=10^{-1.7} \mathrm{~mol} \mathrm{dm}^{-3}=0.038 \mathrm{~mol} \mathrm{dm}^{-3} \\
& \mathrm{~mol} \mathrm{dm}^{-3}
\end{aligned}
$$

$K_{b}=\frac{\left(c_{0}(\mathrm{COOH})-\mathrm{x}\right) /\left(1 \mathrm{~mol} \mathrm{dm}^{-3}\right) \times c\left(\mathrm{OH}^{-}\right) /\left(1 \mathrm{~mol} \mathrm{dm}^{-3}\right)}{\mathrm{x} /\left(1 \mathrm{~mol} \mathrm{dm}^{-3}\right)}$
$c_{0}(\mathrm{COOH})=\frac{K_{b} \times \times\left(1 \mathrm{~mol} \mathrm{dm}^{-3}\right)}{c\left(\mathrm{OH}^{-}\right)}+\mathrm{x}$
$c_{0}(\mathrm{COOH})=\left(\frac{0.018 \times 10^{-9.12}}{0.02}+0.018\right) \mathrm{mol} \mathrm{dm}^{-3}$
$c_{0}(\mathrm{COOH})=0.018 \mathrm{~mol} \mathrm{dm}^{-3}$
(Or as $\left.\mathrm{pH} \gg \mathrm{pK}_{a}: \quad c_{0}(\mathrm{COOH})=c(\mathrm{COOH})+\mathrm{x} \approx \mathrm{x}\right)$
Total concentration of polymer chains $\quad c($ polymer $)=\frac{c_{0}(\mathrm{COOH})}{8}$
$M($ polymer $)=M\left(\mathrm{C}_{160} \mathrm{O}_{84} \mathrm{H}_{306}\right)=3574.66 \mathrm{~g} \mathrm{~mol}^{-1}$
$m($ polymer $)=c($ polymer $) \times V \times M($ polymer $)$
$m($ polymer $)=\frac{c_{0}(\mathrm{COOH}) \times V \times M(\text { polymer })}{8}=\frac{0.018 \times 0.250 \times 3574.66}{8} \mathrm{~g}=2.0 \mathrm{~g}$
8.5 Modification of $\mathrm{CaCO}_{3}$ :

The charge of the particles is caused by the number of protolized COOH groups per particle.
$c\left(\mathrm{COO}^{-}\right) \approx c_{0}(\mathrm{COOH}), \alpha \approx 1$

Number of COOH groups per particle:

$$
N_{\mathrm{COOH}}=\frac{|Z|}{\alpha} \quad N_{\mathrm{COOH}}=800
$$

Number of polymer chains per particle: $\quad N_{\text {polymer }}=\frac{N_{\text {cooh }}}{8}=100$

The number of polymers per particle indicates the mass of polymer per particle.
Thus, the mass of the calcium carbonate particle can be calculated:
$M\left(\mathrm{CaCO}_{3}\right.$ particle $)=M$ (total particle) $-N_{\text {polymer }} M$ (polymer)
$M\left(\mathrm{CaCO}_{3}\right.$ particle $)=8.01 \times 10^{8} \mathrm{~g} \mathrm{~mol}^{-1}-100 \times 3574.66 \mathrm{~g} \mathrm{~mol}^{-1}$
$M\left(\mathrm{CaCO}_{3}\right.$ particle $)=8.01 \times 10^{8} \mathrm{~g} \mathrm{~mol}^{-1}$

Mass of one $\mathrm{CaCO}_{3}$ particle: $\quad m\left(\mathrm{CaCO}_{3}\right.$ particle $)=M\left(\mathrm{CaCO}_{3}\right.$ particle $) \cdot N_{A}{ }^{-1}$
and with the volume of the spherical particle $\left(V=\frac{4}{3} \pi r^{3}\right)$ the density can be calculated:

$$
\begin{aligned}
\rho\left(\mathrm{CaCO}_{3}\right) & =\frac{m\left(\mathrm{CaCO}_{3} \text { particle }\right)}{V\left(\mathrm{CaCO}_{3} \text { particle }\right)}=\frac{3 m\left(\mathrm{CaCO}_{3} \text { particle }\right)}{4 \pi r^{3}} \\
& =\frac{\left.3(M \text { (total particle })-N_{\text {polymer }} M(\text { polymer })\right)}{N_{\mathrm{a}} 4 \pi r^{3}} \\
& =\frac{3 \times 8.01 \times 10^{8} \mathrm{~g} \mathrm{~mol}^{-1}}{N_{A} \cdot 4 \pi\left(5 \times 10^{-6} \mathrm{~cm}\right)^{3}}=2.54 \mathrm{~g} \mathrm{~cm}^{-3}
\end{aligned}
$$

The modification of calcium carbonate is Calcite $\square$ Vaterite $\begin{aligned} & \text { Aragonite }\end{aligned}$

## PROBLEM 6

## Alkalinity of Water and Solubility of $\mathbf{C O}_{\mathbf{2}}$

The capacity of water to accept $\mathrm{H}^{+}$ions is called alkalinity. Alkalinity is important in water treatment and in the chemistry and biology of natural waters. Generally, the basic species responsible for alkalinity in water are $\mathrm{HCO}_{3}^{-}, \mathrm{CO}_{3}^{2-}$, and OH . At pH values below $7, \mathrm{H}^{+}$in water detracts significantly from alkalinity. Therefore, the complete equation for alkalinity in a medium where $\mathrm{HCO}_{3}^{-}, \mathrm{CO}_{3}^{2-}$, and $\mathrm{OH}^{-}$are the only contributors to alkalinity can be expressed as

$$
\text { alkalinity }=\left[\mathrm{HCO}_{3}^{-}\right]+2\left[\mathrm{CO}_{3}^{2-}\right]+\left[\mathrm{OH}^{-}\right]-\left[\mathrm{H}^{+}\right]
$$

The contributions made by different species to alkalinity depend upon pH . Relevant chemical equations and equilibrium constants (at 298 K ) are shown below:

$$
\begin{array}{ll}
\mathrm{CO}_{2(\mathrm{~g})} \rightleftharpoons \mathrm{CO}_{2(\mathrm{aq})} & K_{\mathrm{CO}_{2}}=3.44 \times 10^{-2} \\
\mathrm{CO}_{2(\mathrm{aq})}+\mathrm{H}_{2} \mathrm{O} \rightleftharpoons \mathrm{H}_{2} \mathrm{CO}_{3} & K_{\mathrm{H}_{2} \mathrm{CO}_{3}}=2.00 \times 10^{-3} \\
\mathrm{H}_{2} \mathrm{CO}_{3} \rightleftharpoons \mathrm{HCO}_{3}^{-}+\mathrm{H}^{+} & K_{a 1}=2.23 \times 10^{-4} \\
\mathrm{HCO}_{3}^{-} \rightleftharpoons \mathrm{CO}_{3}^{2-}+\mathrm{H}^{+} & K_{\mathrm{a} 2}=4.69 \times 10^{-11} \\
\mathrm{CaCO}_{3(\mathrm{~s})} \rightleftharpoons \mathrm{Ca}^{2+}+\mathrm{CO}_{3}^{2-} & K_{\mathrm{Sp}}=4.50 \times 10^{-9} \\
\mathrm{H}_{2} \mathrm{O} \rightleftharpoons \mathrm{H}^{+}+\mathrm{OH}^{-} & K_{W}=1.00 \times 10^{-14}
\end{array}
$$

Note: Calculations must be shown.
6.1 Natural waters (river or lake water) generally contain dissolved $\mathrm{CO}_{2}$. The ratio of $\left[\mathrm{H}_{2} \mathrm{CO}_{3}\right]:\left[\mathrm{HCO}_{3}^{-}\right]:\left[\mathrm{CO}_{3}^{2-}\right]$ in a water at $\left[\mathrm{H}^{+}\right]=1.00 \times 10^{-7} \mathrm{M}$ will be:

$$
\text { (a) : } 1.00:(b) . \text { Calculate (a) and (b). }
$$

6.2 Gaseous $\mathrm{CO}_{2}$ in the atmosphere can be regarded as a contributor to the alkalinity of water in equilibrium with air. Calculate the concentration of $\mathrm{CO}_{2}$ (aq) $\left(\mathrm{mol} \mathrm{dm}^{-3}\right)$ in pure water that is in equilibrium with the unpolluted air at $1.01 \times 10^{5} \mathrm{~Pa}$ and 298 K containing $0.0360 \%$ (molar ratio) $\mathrm{CO}_{2}$. (assuming standard pressure $=1.01 \times 10^{5} \mathrm{~Pa}$ ).

If you are unable to solve this problem, assume that concentration of equal to $1.11 \times 10^{-5} \mathrm{M}$ for further calculations.

The solubility $(S)$ of $\mathrm{CO}_{2}$ in water can be defined as

$$
S=\left[\mathrm{CO}_{2(\mathrm{aq})}\right]+\left[\mathrm{H}_{2} \mathrm{CO}_{3}\right]+\left[\mathrm{HCO}_{3}^{-}\right]+\left[\mathrm{CO}_{3}^{2-}\right] .
$$

The solubility of atmospheric $\mathrm{CO}_{2}$ in water that is in equilibrium with the unpolluted air at 298 K and $1.01 \times 10^{5} \mathrm{~Pa}$ will vary with alkalinity.
6-3 Find the solubility of atmospheric $\mathrm{CO}_{2}$ in pure water $\left(\mathrm{mol} \mathrm{dm}^{-3}\right)$. Neglect dissociation of water.
6.4 Find the solubility of atmospheric $\mathrm{CO}_{2}\left(\mathrm{~mol} \mathrm{dm}^{-3}\right)$ in a $1.00 \times 10^{-3} \mathrm{~mol} \mathrm{dm}^{-3} \mathrm{NaOH}$ solution.

At $298 \mathrm{~K}, 1.01 \times 10^{5} \mathrm{~Pa}$ unpolluted air is in equilibrium with natural water saturated with $\mathrm{CaCO}_{3}$. The following main equilibrium may exist:

$$
\mathrm{CaCO}_{3(\mathrm{~s})}+\mathrm{CO}_{2(\mathrm{aq})}+\mathrm{H}_{2} \mathrm{O} \rightleftharpoons \mathrm{Ca}^{2+}+2 \mathrm{HCO}_{3}^{-}
$$

6.5 Calculate the equilibrium constant for the above equation.

If you are unable to solve this problem, assume that equilibrium constant $K_{e q}=5.00 \times 10^{-5}$ for further calculations.
6.6 Calculate the concentration of $\mathrm{Ca}^{2+}\left(\mathrm{mg} \mathrm{dm}^{-3}\right)$ in $\mathrm{CaCO}_{3}$-saturated natural water that is in equilibrium with atmospheric $\mathrm{CO}_{2}$.

If you are unable to solve this problem, assume that concentration of $\mathrm{Ca}^{2+}{ }_{(a q)}=40.1$ $\mathrm{mg} \mathrm{dm}{ }^{-3}$ for further calculations.
6.7 Find the alkalinity ( $\mathrm{mol} / \mathrm{L}$ ) of the above solution.
6.8 In an underground lake saturated with $\mathrm{CaCO}_{3}$, the water has a high content of $\mathrm{CO}_{2}$. The concentration of $\mathrm{Ca}^{2+}$ in this lake was found to be as high as $100 \mathrm{mg} \mathrm{dm}^{-3}$. Assume the lake and the air above is a closed system, calculate the effective pressure of $\mathrm{CO}_{2}(\mathrm{~Pa})$ in air which is in equilibrium with this $\mathrm{Ca}^{2+}$ content.

## SOLUTION

$6.1\left[\mathrm{H}^{+}\right]=1.00 \times 10^{-7}$
$K_{\mathrm{a} 1}=\left[\mathrm{HCO}_{3}^{-}\right]\left[\mathrm{H}^{+}\right] /\left[\mathrm{H}_{2} \mathrm{CO}_{3}\right]=2.23 \times 10^{-4}$,
$\left[\mathrm{HCO}_{3}^{-}\right] /\left[\mathrm{H}_{2} \mathrm{CO}_{3}\right]=2.23 \times 10^{3}$
$K_{\mathrm{a} 2}=\left[\mathrm{CO}_{3}^{2-}\right]\left[\mathrm{H}^{+}\right] /\left[\mathrm{HCO}_{3}^{-}\right]=4.69 \times 10^{-11}$,
$\left[\mathrm{CO}_{3}^{2-}\right] /\left[\mathrm{HCO}_{3}^{-}\right]=4.69 \times 10^{-4}$
$\left[\mathrm{H}_{2} \mathrm{CO}_{3}\right]:\left[\mathrm{HCO}_{3}^{-}\right]:\left[\mathrm{CO}_{3}^{2-}\right]=4.48 \times 10^{-4}: 1.00: 4.69 \times 10^{-4}$
$6.2 p\left(\mathrm{CO}_{2}(\mathrm{aq})\right)=1.01 \times 10^{5} \mathrm{~Pa} \times 3.60 \times 10^{-4}=36.36 \mathrm{~Pa}$ $\left[\mathrm{CO}_{2}(\mathrm{aq})\right]=K \mathrm{CO}_{2} \times p\left(\mathrm{CO}_{2}\right)=0.0344 \times\left(36.36 \mathrm{~Pa} / 1.01 \times 10^{5} \mathrm{~Pa}\right)=\mathbf{1 . 2 4 \times 1 0 ^ { - 5 }}$
(If you are unable to solve this problem, for further calculations assume that $\left[\mathrm{CO}_{2}(\mathrm{aq})\right]=$ $1.11 \times 10^{-5}$.)

## 6.3

(a) Solubility $=\left[\mathrm{CO}_{2}(\mathrm{aq})\right]+\left[\mathrm{H}_{2} \mathrm{CO}_{3}\right]+\left[\mathrm{HCO}_{3}^{-}\right]+\left[\mathrm{CO}_{3}^{2-}\right] \approx\left[\mathrm{CO}_{2}(\mathrm{aq})\right]+\left[\mathrm{HCO}_{3}^{-}\right]$ $\left(\left[\mathrm{H}_{2} \mathrm{CO}_{3}\right]=\left[\mathrm{CO}_{2}(\mathrm{aq})\right] \times K_{\mathrm{H}_{2} \mathrm{CO}_{3}}=2.48 \times 10^{-8}\right.$
and $\left[\mathrm{CO}_{3}^{2-}\right]=\mathrm{K}_{\mathrm{a} 2} /\left(\left[\mathrm{H}^{+}\right] /\left[\mathrm{HCO}_{3}^{-}\right]\right)=K_{\mathrm{a} 2}=4.69 \times 10^{-11}$
both can be neglected.)
$\left[\mathrm{H}^{+}\right]\left[\mathrm{HCO}_{3}^{-}\right] /\left[\mathrm{CO}_{2}(\mathrm{aq})\right]=K_{\mathrm{a} 1} K_{\mathrm{H}_{2} \mathrm{CO}_{3}}=\left(2.23 \times 10^{-4}\right)\left(2.00 \times 10^{-3}\right)=4.46 \times 10^{-7}$
From 6-2: $\left[\mathrm{CO}_{2}(\mathrm{aq})\right]=1.24 \times 10^{-5}$,

$$
\left[\mathrm{H}^{+}\right]=\left[\mathrm{HCO}_{3}^{-}\right]=2.35 \times 10^{-6}
$$

Solubility $=\left[\mathrm{CO}_{2}(\mathrm{aq})\right]+\left[\mathrm{HCO}_{3}^{-}\right]=1.24 \times 10^{-5}+2.35 \times 10^{-6}=1.48 \times 10^{-5} \mathrm{~mol} \mathrm{dm}$
(b) (Using $\left[\mathrm{CO}_{2}(\mathrm{aq})\right]=1.11 \times 10^{-5}$ for calculation)

Solubility $=\left[\mathrm{CO}_{2}(\mathrm{aq})\right]+\left[\mathrm{H}_{2} \mathrm{CO}_{3}\right]+\left[\mathrm{HCO}_{3}^{-}\right]+\left[\mathrm{CO}_{3}^{2-}\right] \approx\left[\mathrm{CO}_{2}(\mathrm{aq})\right]+\left[\mathrm{HCO}_{3}^{-}\right]$
$\left(\left[\mathrm{H}_{2} \mathrm{CO}_{3}\right]=\left[\mathrm{CO}_{2}(\mathrm{aq})\right] \times K_{\mathrm{H}_{2} \mathrm{CO}_{3}}=2.22 \times 10^{-8}\right.$ and $\left[\mathrm{CO}_{3}^{2-}\right]=K_{a 2} /\left(\left[\mathrm{H}^{+}\right] /\left[\mathrm{HCO}_{3}^{-}\right]\right)=$ $K_{a 2}=4.69 \times 10^{-11}$ both can be neglected.)
$\left[\mathrm{H}^{+}\right]\left[\mathrm{HCO}_{3}^{-}\right] /\left[\mathrm{CO}_{2}(\mathrm{aq})\right]=K_{a 1} K_{\mathrm{H}_{2} \mathrm{CO}_{3}}=\left(2.23 \times 10^{-4}\right)\left(2.00 \times 10^{-3}\right)=4.46 \times 10^{-7}$

From 6.2: $\left[\mathrm{CO}_{2}(\mathrm{aq})\right]=1.11 \times 10^{-5}$

$$
\left[\mathrm{H}^{+}\right]=\left[\mathrm{HCO}_{3}^{-}\right]=2.225 \times 10^{-6}
$$

$$
\text { Solubility }=\left[\mathrm{CO}_{2}(\mathrm{aq})\right]+\left[\mathrm{HCO}_{3}^{-}\right]=1.11 \times 10^{-5}+2.225 \times 10^{-6}=1.34 \times 10^{-5}
$$

6.4 (Using $\left[\mathrm{CO}_{2( }(\mathrm{aq})\right]=1.24 \times 10^{-5}$ for calculation)

In $1.00 \times 10^{-3} \mathrm{~mol} \mathrm{dm}^{-3} \mathrm{NaOH}$ solution the solubility of $\mathrm{CO}_{2}$ will be much higher because of the following reactions:

$$
\begin{equation*}
\mathrm{CO}_{2}(\mathrm{aq})+2 \mathrm{OH}^{-} \rightleftharpoons \mathrm{CO}_{3}^{2-}+\mathrm{H}_{2} \mathrm{O} \quad K=K_{\mathrm{H}_{2} \mathrm{CO}_{3}} \times K_{\mathrm{a} 1} \times K_{22} /\left(1.00 \times 10^{-14}\right)^{2}= \tag{1}
\end{equation*}
$$

$$
2.09 \times 10^{11}
$$

(2) $\mathrm{CO}_{2}(\mathrm{aq})+\mathrm{CO}_{3}^{2-}+\mathrm{H}_{2} \mathrm{O} \rightleftharpoons 2 \mathrm{HCO}_{3}^{-} \quad K=K_{\mathrm{H}_{2} \mathrm{CO}_{3}} \times K_{a 1} / K_{a 2}=9.37 \times 10^{3}$

Combining (1) and (2): $\mathrm{CO}_{2}(\mathrm{aq})+\mathrm{OH}^{-} \rightleftharpoons \mathrm{HCO}_{3}^{-} \mathrm{K}=4.43 \times 10^{7}$
With such a large $K$ value all $\mathrm{OH}^{-}$will finally be converted to $\mathrm{HCO}_{3}^{-}$.

$$
\left[\mathrm{HCO}_{3}^{-}\right]=1.00 \times 10^{-3}
$$

$[\mathrm{OH}]=1.82 \times 10^{-6}$
$\left[\mathrm{H}^{+}\right]=5.49 \times 10^{-9} \quad\left[\mathrm{CO}_{3}^{2-}\right]=8.54 \times 10^{-6}$
Solubility $=\left[\mathrm{CO}_{2}(\mathrm{aq})\right]+\left[\mathrm{H}_{2} \mathrm{CO}_{3}\right]+\left[\mathrm{HCO}_{3}^{-}\right]+\left[\mathrm{CO}_{3}^{2-}\right] \approx\left[\mathrm{CO}_{2}(\mathrm{aq})\right]+\left[\mathrm{HCO}_{3}^{-}\right]+\left[\mathrm{CO}_{3}^{2-}\right]=$ $=1.24 \times 10^{-5}+1.00 \times 10^{-3}+8.54 \times 10^{-6}=1.02 \times 10^{-3} \mathrm{~mol} \mathrm{dm}^{-3}$
$6.5 K_{e q}=K_{\text {sp }} \times K_{\mathrm{H}_{2} \mathrm{CO}_{3}} \times K_{a 1} / K_{a 2}=\left(4.50 \times 10^{-9}\right) \times\left(2.00 \times 10^{-3}\right) \times\left(2.23 \times 10^{-4}\right) /\left(4.69 \times 10^{-11}\right)=$ $=4.28 \times 10^{-5}$
(If you are unable to solve this problem, assume that $K_{e q}=5.00 \times 10^{-5}$ for further calculations.)

## 6.6

(a) (Using $K_{\text {eq }}=4.28 \times 10^{-5}$ and $\left[\mathrm{CO}_{2}(\mathrm{aq})\right]=1.24 \times 10^{-5}$ for calculation)

Mass balance : $\left[\mathrm{HCO}_{3}^{-}\right]=2\left[\mathrm{Ca}^{2+}\right]$
From 6.5: $K=4.28 \times 10^{-5}=\left[\mathrm{Ca}^{2+}\right]\left[\mathrm{HCO}_{3}^{-}\right] /\left[\mathrm{CO}_{2}(\mathrm{aq})\right]=\left[\mathrm{Ca}^{2+}\right]\left(2\left[\mathrm{Ca}^{2+}\right]\right)^{2} /\left[\mathrm{CO}_{2}(\mathrm{aq})\right]$
From 6.2: $\left[\mathrm{CO}_{2}(\mathrm{aq})\right]=1.24 \times 10^{-5}$
$\left[\mathrm{Ca}^{2+}\right]=0.510 \times 10^{-3}=20.5 \mathrm{mg} \mathrm{dm}^{-3}$
(b) (Using $K_{e q}=5.00 \times 10^{-5}$ and $\left[\mathrm{CO}_{2}(\mathrm{aq})\right]=1.11 \times 10^{-5}$ for calculation)

Mass balance : $\left[\mathrm{HCO}_{3}^{-}\right]=2\left[\mathrm{Ca}^{2+}\right]$
From 6.5: $K=5.00 \times 10^{-5}=\left[\mathrm{Ca}^{2+}\right]\left[\mathrm{HCO}_{3}^{-}\right]^{2} /\left[\mathrm{CO}_{2}(\mathrm{aq})\right]=\left[\mathrm{Ca}^{2+}\right]\left(2\left[\mathrm{Ca}^{2+}\right]\right)^{2} /\left[\mathrm{CO}_{2}(\mathrm{aq})\right]$
From 6.2: $\left[\mathrm{CO}_{2}(\mathrm{aq})\right]=1.11 \times 10^{-5}$
$\left[\mathrm{Ca}^{2+}\right]=$
$0.5177 \times 10^{-3}=20.75 \mathrm{mg} \mathrm{dm}^{-3}$
(c) (Using $K_{e q}=5.00 \times 10^{-5}$ and $\left[\mathrm{CO}_{2}(\mathrm{aq})\right]=1.24 \times 10^{-5}$ for calculation)

Mass balance : $\left[\mathrm{HCO}_{3}^{-}\right]=2\left[\mathrm{Ca}^{2+}\right]$
From 6.5: $K=5.00 \times 10^{-5}=\left[\mathrm{Ca}^{2+}\right]\left[\mathrm{HCO}_{3}^{-}\right]^{2} /\left[\mathrm{CO}_{2}(\mathrm{aq})\right]=\left[\mathrm{Ca}^{2+}\right]\left(2\left[\mathrm{Ca}^{2+}\right]\right)^{2} /\left[\mathrm{CO}_{2}(\mathrm{aq})\right]$
From 6.2: $\left[\mathrm{CO}_{2}(\mathrm{aq})\right]=1.24 \times 10^{-5}$
$\left[\mathrm{Ca}^{2+}\right]=$
$0.5372 \times 10^{-3}=21.53 \mathrm{mg} \mathrm{dm}^{-3}$
(d) (Using $K_{e q}=4.28 \times 10^{-5}$ and $\left[\mathrm{CO}_{2}(\mathrm{aq})\right]=1.11 \times 10^{-5}$ for calculation)

Mass balance : $\left[\mathrm{HCO}_{3}^{-}\right]=2\left[\mathrm{Ca}^{2+}\right]$
From 6.5: $K=4.28 \times 10^{-5}=\left[\mathrm{Ca}^{2+}\right]\left[\mathrm{HCO}_{3}^{-}\right]^{2} /\left[\mathrm{CO}_{2}(\mathrm{aq})\right]=\left[\mathrm{Ca}^{2+}\right]\left(2\left[\mathrm{Ca}^{2+}\right]\right)^{2} /\left[\mathrm{CO}_{2}(\mathrm{aq})\right]$
From 6.2: $\left[\mathrm{CO}_{2}(\mathrm{aq})\right]=1.11 \times 10^{-5}$
$\left[\mathrm{Ca}^{2+}\right]=$
$0.4916 \times 10^{-3}=19.70 \mathrm{mg} \mathrm{dm}^{-3}$
(If you are unable to solve this problem, assume that $\left[\mathrm{Ca}^{2 *}\right]_{(a q)}=40.1$ for further calculations.)
$6.7 \mathrm{HCO}_{3}^{-}$is the major species in solution.
The $p H$ of the solution can be estimated as $p H=\left(p K_{a 1}+p K_{a 2}\right) / 2=(3.65+10.33) / 2=$ $=6.99 \approx 7.00$,
where $K_{a 1}$ and $K_{a 2}$ are the dissociation constants of $\mathrm{H}_{2} \mathrm{CO}_{3}$.
At pH 7.00, both $[\mathrm{OH}]$ and $\left[\mathrm{H}^{+}\right]$can be neglected. Besides, $\left[\mathrm{CO}_{3}^{2-}\right] \ll\left[\mathrm{HCO}_{3}^{-}\right]$
(from 6.1)
Alkalinity $=\left[\mathrm{HCO}_{3}^{-}\right]+2\left[\mathrm{CO}_{3}^{2-}\right]+[\mathrm{OH}]-\left[\mathrm{H}^{+}\right] \approx\left[\mathrm{HCO}_{3}^{-}\right]$

From 6-6, mass balance, $\left[\mathrm{HCO}_{3}^{-}\right]=2\left[\mathrm{Ca}^{2+}\right]$
(a) $1.02 \times 10^{-3}$ (using $\left.\left[\mathrm{Ca}^{2+}\right]_{(\mathrm{aq}}\right)$ from 6.6 (a))
(b) $1.035 \times 10^{-3}$ (using $\left[\mathrm{Ca}^{2+}\right]_{\text {(aq) }}$ ) from 6.6 (b))
(c) $1.0744 \times 10^{-3}$ (using $\left[\mathrm{Ca}^{2+}\right]_{\text {(aq) }}$ from 6-6 (c))
(d) $0.9831 \times 10^{-3}$ (using $\left[\mathrm{Ca}^{2+}\right]_{(\mathrm{aq})}$ from 6-6 (d))
(e) $2.00 \times 10^{-3}$ (assuming $\left[\mathrm{Ca}^{2+}\right]_{(a q)}=40.1$ )

Alkalinity $=(\mathrm{a})$ or (b) or (c) or (d) or (e)

## 6.8

(a) (Using $K_{\text {eq }}=4.28 \times 10^{-5}$ for calculation)

Mass balance : $\left[\mathrm{HCO}_{3}^{-}\right]=2\left[\mathrm{Ca}^{2+}\right]$
$\left[\mathrm{Ca}^{2+}\right]=100 \mathrm{mg} \mathrm{dm}^{-3}=2.50 \times 10^{-3} \mathrm{~mol} \mathrm{dm}^{-3}$
Inserting into $K_{e q}=4.28 \times 10^{-5}=\left[\mathrm{Ca}^{2+}\right]\left[\mathrm{HCO}_{3}^{-}\right]^{2} /\left[\mathrm{CO}_{2}(\mathrm{aq})\right]=4\left[\mathrm{Ca}^{2+}\right] /\left[\mathrm{CO}_{2}(\mathrm{aq})\right]$
$\left[\mathrm{CO}_{2}(\mathrm{aq})\right]=1.46 \times 10$
$p_{\mathrm{CO}_{2}}=\left(\left[\mathrm{CO}_{2}(\mathrm{aq})\right] / K_{\mathrm{CO}_{2}}\right) \times 1.01 \times 10^{5} \mathrm{~Pa}=4.28 \times 10^{3} \mathrm{~Pa}$
(b) (Using $K_{\text {eq }}=5.00 \times 10^{-5}$ for calculation)

Mass balance : $\left[\mathrm{HCO}_{3}^{-}\right]=2\left[\mathrm{Ca}^{2+}\right]$
$\left[\mathrm{Ca}^{2+}\right]=100 \mathrm{mg} \mathrm{dm}^{-3}=2.50 \times 10^{-3} \mathrm{~mol} \mathrm{dm}^{-3}$
Inserting into $K_{e q}=5.00 \times 10^{-5}=\left[\mathrm{Ca}^{2+}\right]\left[\mathrm{HCO}_{3}^{-}\right]^{2} /\left[\mathrm{CO}_{2}(\mathrm{aq})\right]=4\left[\mathrm{Ca}^{2+}\right] /\left[\mathrm{CO}_{2}(\mathrm{aq})\right]$
$\left[\mathrm{CO}_{2}(\mathrm{aq})\right]=1.25 \times 10^{-3}$
$p_{\mathrm{CO}_{2}}=\left(\left[\mathrm{CO}_{2}(\mathrm{aq})\right] / K_{\mathrm{CO}_{2}}\right) \times 1.01 \times 10^{5} \mathrm{~Pa}=3.67 \times 10^{3} \mathrm{~Pa}$

## PROBLEM 5

## Acid-Base Chemistry

5.1 Calculate $\left[\mathrm{H}^{+}\right],\left[\mathrm{OH}^{-}\right],\left[\mathrm{HSO}_{4}{ }^{-}\right]$, and $\left[\mathrm{SO}_{4}{ }^{2-}\right]$ in a $1.0 \times 10^{-7} \mathrm{M}$ solution of sulfuric acid ( $K_{\mathrm{w}}=1.0 \times 10^{-14}, K_{2}=1.2 \times 10^{-2}$ at 25 C ). In your work you may use mass- and charge-balance equations. Answer with two significant figures.
5.2 Calculate the volume of 0.80 M NaOH solution that should be added to a $250 \mathrm{~cm}^{3}$ aqueous solution containing $3.48 \mathrm{~cm}^{3}$ of concentrated phosphoric acid in order to prepare a pH 7.4 buffer. Answer with three significant figures. $\left(\mathrm{H}_{3} \mathrm{PO}_{4}(\mathrm{aq})\right.$, purity $=$ 85 mass $\%$, density $\left.=1.69 \mathrm{~g} / \mathrm{cm}^{3}, M_{r}=98.00\right)\left(\mathrm{p} K_{1}=2.15, \mathrm{p} K_{2}=7.20, \mathrm{p} K_{3}=12.44\right)$.
5.3 The efficacy of a drug is greatly dependent on its ability to be absorbed into the blood stream. Acid-base chemistry plays an important role in drug absorption.

Assume that the ionic form ( $\mathrm{A}^{-}$) of a weakly acidic drug does not penetrate the membrane, whereas the neutral form (HA) freely crosses the membrane. Also assume that equilibrium is established so that the concentration of HA is the same on both sides. Calculate the ratio of the total concentration ([HA] + [A]) of aspirin (acetylsalicylic acid, $\mathrm{p} K=3.52$ ) in the blood to that in the stomach.

## SOLUTION

5.1 1st ionization is complete: $\mathrm{H}_{2} \mathrm{SO}_{4} \rightarrow \mathrm{H}^{+}+\mathrm{HSO}_{4}^{-}$
$\left[\mathrm{H}_{2} \mathrm{SO}_{4}\right]=0$

2nd ionization: $\left[\mathrm{H}^{+}\right]\left[\mathrm{SO}_{4}^{2-}\right] /\left[\mathrm{HSO}_{4}^{-}\right]=K_{2}=1.2 \times 10^{-2}$
Mass balance: $\left[\mathrm{H}_{2} \mathrm{SO}_{4}\right]+\left[\mathrm{HSO}_{4}^{-}\right]+\left[\mathrm{SO}_{4}^{2-}\right]=1.0 \times 10^{-7}$
Charge balance: $\left[\mathrm{H}^{+}\right]=\left[\mathrm{HSO}_{4}^{-}\right]+2\left[\mathrm{SO}_{4}^{2-}\right]+\left[\mathrm{OH}^{-}\right]$
Degree of ionization is increased upon dilution.
$\left[\mathrm{H}_{2} \mathrm{SO}_{4}\right]=0$
Assume $\left[\mathrm{H}^{+}\right]_{\mathrm{H}_{2} \mathrm{SO}_{4}}=2 \times 10^{-7}$
From (1): $\left[\mathrm{SO}_{4}^{2-}\right] /\left[\mathrm{HSO}_{4}^{-}\right]=6 \times 10^{4}$ (2nd ionization is almost complete)
$\left[\mathrm{HSO}_{4}^{-}\right]=0$
From (2): $\left[\mathrm{SO}_{4}^{2-}\right]=1.0 \times 10^{-7}$
From (3): $\left[\mathrm{H}^{+}\right]=\left(2 \times 10^{-7}\right)+10^{-14} /\left[\mathrm{H}^{+}\right]$
$\left[\mathrm{H}^{+}\right]=2.4 \times 10^{-7} \quad(\mathrm{pH}=6.6)$
$\left[\mathrm{OH}^{-}\right]=1 \times 10^{-14} /\left(2.4 \times 10^{-7}\right)=4.1 \times 10^{-8}$

From (1):
$\left[\mathrm{HSO}_{4}^{-}\right]=\left[\mathrm{H}^{+}\right]\left[\mathrm{SO}_{4}^{2-}\right] / K_{2}=\left(2.4 \times 10^{-7}\right) \times\left(1.0 \times 10^{-7}\right) /\left(1.2 \times 10^{-2}\right)=2.0 \times 10^{-12}$

Check charge balance:
$2.4 \times 10^{-7} \approx\left(2.0 \times 10^{-12}\right)+2\left(1.0 \times 10^{-7}\right)+\left(4.1 \times 10^{-8}\right)$
Check mass balance:

$$
0+2.0 \times 10^{-12}+1.0 \times 10^{-7} \approx 1.0 \times 10^{-7}
$$

$5.2 n\left(\mathrm{H}_{3} \mathrm{PO}_{4}\right)=0.85 \times 3.48 \mathrm{~cm}^{3} \times 1.69 \mathrm{~g} \mathrm{~cm}^{-3} \times 1 \mathrm{~mol} / 98.00 \mathrm{~g} \times 1000=51.0 \mathrm{mmol}$ The desired pH is above $\mathrm{p} K_{2}$.

A $1: 1$ mixture of $\mathrm{H}_{2} \mathrm{PO}_{4}^{-}$and $\mathrm{HPO}_{4}^{2-}$ would have $p H=p K_{2}=7.20$.
If the pH is to be 7.40 , there must be more $\mathrm{HPO}_{4}^{2-}$ than $\mathrm{H}_{2} \mathrm{PO}_{4}^{-}$.
We need to add NaOH to convert $\mathrm{H}_{3} \mathrm{PO}_{4}$ to $\mathrm{H}_{2} \mathrm{PO}_{4}^{-}$and to convert to the right amount of $\mathrm{H}_{2} \mathrm{PO}_{4}^{-}$to $\mathrm{HPO}_{4}^{2-}$.

$$
\begin{aligned}
& \mathrm{H}_{3} \mathrm{PO}_{4}+\mathrm{OH}^{-} \rightarrow \mathrm{H}_{2} \mathrm{PO}_{4}^{-}+\mathrm{H}_{2} \mathrm{O} \\
& \mathrm{H}_{2} \mathrm{PO}_{4}^{-}+\mathrm{OH}^{-} \rightarrow \mathrm{HPO}_{4}^{2-}+\mathrm{H}_{2} \mathrm{O}
\end{aligned}
$$

The volume of 0.80 NaOH needed to react with to convert $\mathrm{H}_{3} \mathrm{PO}_{4}$ to $\mathrm{H}_{2} \mathrm{PO}_{4}^{-}$is:
$51.0 \mathrm{mmol} / 0.80 \mathrm{~mol} \mathrm{dm}^{-3}=63.75 \mathrm{~cm}^{3}$

To get pH of 7.40 we need:

| $\mathrm{H}_{2} \mathrm{PO}_{4}^{-}+\mathrm{OH}^{-} \rightarrow \mathrm{HPO}_{4}^{2-}$ |  |  |  |
| :--- | :---: | :--- | :--- |
|  |  |  |  |
| Initial mmol | 51.0 | $x$ | 0 |
| Final mmol | $51.0-x$ | 0 | $x$ |

$p H=p K_{2}+\log \left[\mathrm{HPO}_{4}^{2-}\right] /\left[\mathrm{H}_{2} \mathrm{PO}_{4}^{-}\right]$
$7.40=7.20+\log \{x /(51.0-x)\} ; \quad x=31.27 \mathrm{mmol}$
The volume of NaOH needed to convert 31.27 mmol is:
$31.27 \mathrm{mmol} / 0.80 \mathrm{~mol} \mathrm{dm}^{-3}=39.09 \mathrm{~cm}^{3}$
The total volume of $\mathrm{NaOH}=63.75+39.09=102.84 \mathrm{~cm}^{3} \approx 103 \mathrm{~cm}^{3}$
$5.3 \mathrm{pK}=3.52$
$p H=p K_{a}+\log ([A] /[H A])$
$[\mathrm{A}] /[\mathrm{HA}]=10^{(p H-p K a)}$

In blood, $\mathrm{pH}=7.40, \quad[\mathrm{~A}] /[\mathrm{HA}]=10^{(7.40-3.52)}=7586$
Total ASA $=7586+1=7587$

In stomach, $\mathrm{pH}=2.00,[\mathrm{~A}] /[\mathrm{HA}]=10^{(2.00-3.52)}=3.02 \times 10^{-2}$
Total ASA $=1+3.02 \times 10^{-2}=1.03$
Ratio of total aspirin in blood to that in stomach $=7587 / 1.03=7400$

## PROBLEM 6

## Electrochemistry

Water is a very stable molecule, abundant on earth and essential for life. As such, water was long thought to be a chemical element. However, soon after the invention of a voltaic cell in 1800, Nicholson and Carlyle decomposed water into hydrogen and oxygen by electrolysis.
6.1 Water can be thought of as hydrogen oxidized by oxygen. Thus, hydrogen can be recovered by reduction of water, using an aqueous solution of sodium sulfate, at a platinum electrode connected to the negative terminal of a battery. The solution near the electrode becomes basic. Write a balanced half-reaction for the reduction of water.
6.2 Water can also be thought of as oxygen reduced by hydrogen. Thus, oxygen can be recovered by oxidation of water at the Pt electrode connected to the positive terminal. Write a balanced half-reaction for the oxidation of water.
6.3 When copper is used at both electrodes, gas is generated only at one electrode during the initial stage of electrolysis. Write the half-reaction at the electrode that does not generate gas.

Another species in solution that can be reduced is sodium ion. The reduction of sodium ion to metallic sodium does not occur in aqueous solution because water is reduced first. However, as Humphrey Davy discovered in 1807, sodium can be made by electrolysis of fused sodium chloride.
6.4 Based on these observations, connect the half-reactions with the standard reduction potential (in volts).
Reduction of copper ion $\left(\mathrm{Cu}^{2+}\right) \quad+0.340$
Reduction of oxygen - 2.710
Reduction of water -0.830
Reduction of sodium ion $\left(\mathrm{Na}^{+}\right) \quad 0.000$
Reduction of hydrogen ion +1.230

The electrode potential is affected by other reactions taking place around the electrode. The potential of the $\mathrm{Cu}^{2+} / \mathrm{Cu}$ electrode in a $0.100 \mathrm{M} \mathrm{Cu}^{2+}$ solution changes as $\mathrm{Cu}(\mathrm{OH})_{2}$ precipitates. Answer with 3 significant figures for the following problems. The temperature is $25{ }^{\circ} \mathrm{C}$. Note that $K_{w}=1.00 \times 10^{-14}$ at $25^{\circ} \mathrm{C}$.
6.5 Precipitation of $\mathrm{Cu}(\mathrm{OH})_{2}$ begins at $\mathrm{pH}=4.84$. Determine the solubility product of $\mathrm{Cu}(\mathrm{OH})_{2}$.
6.6 Calculate the standard reduction potential for $\mathrm{Cu}(\mathrm{OH})_{2}(\mathrm{~s})+2 \mathrm{e}^{-} \rightarrow \mathrm{Cu}(\mathrm{s})+2 \mathrm{OH}^{-}$.
6.7 Calculate the electrode potential at $\mathrm{pH}=1.00$.

Lithium cobalt oxide and specialty carbon are active ingredients for the positive and negative electrodes, respectively, of a rechargeable lithium battery. During the charge recharge cycles, the following reversible half-reactions occur.

$$
\begin{aligned}
& \mathrm{LiCoO}_{2} \rightleftarrows \mathrm{Li}_{1-\mathrm{x}} \mathrm{CoO}_{2}+x \mathrm{Li}^{+}+\mathrm{xe}^{-} \\
& \mathrm{C}+\mathrm{xLi}^{+}+\mathrm{xe}^{-} \rightleftarrows \mathrm{CLi}_{x}
\end{aligned}
$$

The total amount of energy a battery can store, is rated in mAh. A battery rated at 1500 mAh can power a device drawing 100 milliamps for 15 hours.
6.8 Graphite has lithium intercalation sites between its layers. Assuming a maximum $6: 1$ carbon-to-lithium intercalation stoichiometry, calculate the theoretical charge capacity of 1.00 gram of graphite to intercalate lithium. Answer in mAh/g with 3 significant figures.

## SOLUTION

6.1 $4 \mathrm{H}_{2} \mathrm{O}+4 \mathrm{e}^{-} \rightarrow 2 \mathrm{H}_{2}(\mathrm{~g})+4 \mathrm{OH}^{-}\left(\right.$or $\left.2 \mathrm{H}_{2} \mathrm{O}+2 \mathrm{e}^{-} \rightarrow \mathrm{H}_{2}(\mathrm{~g})+2 \mathrm{OH}^{-}\right)$
$6.22 \mathrm{H}_{2} \mathrm{O} \rightarrow \mathrm{O}_{2}+4 \mathrm{H}^{+}+4 \mathrm{e}^{-} \quad\left(\right.$ or $\left.\mathrm{H}_{2} \mathrm{O} \rightarrow 1 / 2 \mathrm{O}_{2}+2 \mathrm{H}^{+}+2 \mathrm{e}^{-}\right)$
6.3 $\mathrm{Cu} \rightarrow \mathrm{Cu}^{2+}+2 \mathrm{e}^{-}$
6.4 Reduction of sodium ion seldom takes place.

It has a highly negative reduction potential of -2.710 V .

Reduction potential for water to hydrogen is negative (water is very stable).
But, it is not as negative as that for sodium ion. It is -0.830 V .
Reduction of both copper ion and oxygen takes place readily and the reduction potentials for both are positive.
In the present system, the reverse reaction (oxidation) takes place at the positive terminal. Copper is oxidized before water.

Reduction potential for hydrogen ion is defined as 0.000 V .

| Reduction of oxygen | -2.710 |
| :---: | :---: |
| Reduction of water | -0.830 |
| Reduction of sodium ion $\left(\mathrm{Na}^{+}\right)$ | 0.000 |
| Reduction of hydrogen ion | +1.230 |

$6.5 \mathrm{pOH}=14.00-4.84=9.16$
$\left[\mathrm{OH}^{-}\right]=6.92 \times 10^{-10}$
$K_{s p}=\left[\mathrm{Cu}^{2+}\right]\left[\mathrm{OH}^{-}\right]^{2}=0.100 \times\left(6.92 \times 10^{-10}\right)=4.79 \times 10^{-20}$
6.6 $E=E^{\circ}\left(\mathrm{Cu}^{2+} / \mathrm{Cu}\right)+(0.0592 / 2) \log \left[\mathrm{Cu}^{2+}\right]=+0.340+(0.0592 / 2) \log \left[\mathrm{Cu}^{2+}\right]=$

$$
=+0.340+(0.0592 / 2) \log \left(K_{\text {sp }} /\left[\mathrm{OH}^{-}\right]^{2}\right)
$$

$$
\begin{aligned}
& =+0.340+(0.0592 / 2) \log K_{s p}-(0.0592 / 2) \log \left[\mathrm{OH}^{-}\right]^{2} \\
& =+0.340+(0.0592 / 2) \log K_{s p}-0.0592 \log \left[\mathrm{OH}^{-}\right]
\end{aligned}
$$

By definition, the standard potential for

$$
\mathrm{Cu}(\mathrm{OH})_{2}(\mathrm{~s})+2 \mathrm{e}^{-} \rightarrow \mathrm{Cu}(\mathrm{~s})+2 \mathrm{OH}^{-}
$$

is the potential where $\left[\mathrm{OH}^{-}\right]=1.00$.

$$
\begin{aligned}
E & =E^{o}\left(\mathrm{Cu}(\mathrm{OH})_{2} / \mathrm{Cu}\right)=+0.340+(0.0592 / 2) \log K_{s p} \\
& =+0.340+(0.0592 / 2) \log \left(4.79 \times 10^{-20}\right) \\
& =+0.340-0.572 \\
& =-0.232 \mathrm{~V}
\end{aligned}
$$

One may solve this problem as follows.
Eqn 1: $\mathrm{Cu}(\mathrm{OH})_{2}(\mathrm{~s})+2 \mathrm{e}^{-} \rightarrow \mathrm{Cu}+2 \mathrm{OH}^{-}$
$E_{+}{ }^{\circ}=E^{o}\left(\mathrm{Cu}(\mathrm{OH})_{2} / \mathrm{Cu}\right)=$ ?

Eqn 2: $\mathrm{Cu}(\mathrm{OH})_{2}(\mathrm{~s}) \rightarrow \mathrm{Cu}^{2+}+2 \mathrm{OH}^{-}$
$E^{\circ}=(0.05916 / n) \log K_{s p}=(0.05916 / 2) \log \left(4.79 \times 10^{-20}\right)=-0.5715 \mathrm{~V}$

Eqn 1 - Eqn $2: \mathrm{Cu}^{2+}+2 \mathrm{e}^{-} \rightarrow \mathrm{Cu}$
$E_{-}^{0}=E_{+}{ }^{\circ}-E^{0}=E^{0}\left(\mathrm{Cu}^{2+} / \mathrm{Cu}\right)=0.34 \mathrm{~V}$
Therefore, $E_{+}{ }^{0}=E_{-}{ }^{0}+E^{0}=+0.34+(-0.5715)==-0.232 \mathrm{~V}$
6.7 Below $\mathrm{pH}=4.84$, there is no effect of $\mathrm{Cu}(\mathrm{OH})_{2}$ because of no precipitation.

Therefore,

$$
\begin{aligned}
E=E\left(\mathrm{Cu}^{2+} / \mathrm{Cu}\right) & =+0.340+(0.0592 / 2) \log \left[\mathrm{Cu}^{2+}\right]= \\
= & +0.340+(0.0592 / 2) \log 0.100=+0.340-0.0296=+0.310 \mathrm{~V}
\end{aligned}
$$

6.81 .00 g graphite $=0.0833 \mathrm{~mol}$ carbon

6 mol carbon to 1 mol lithium; 1 g graphite can hold 0.0139 mol lithium
To insert 1 mol lithium, 96487 coulombs are needed.
Therefore, 1 g graphite can charge $96487 \times 0.0139=1340$ coulombs .
1340 coulombs $/ \mathrm{g}=1340 \mathrm{~A} \sec / \mathrm{g}=1340 \times 1000 \mathrm{~mA} \times(1 / 3600) \mathrm{h}=$
$=372 \mathrm{mAh} / \mathrm{g}$

## PROBLEM 4

## Determination of water by Fischer titraton

Determination of water by the classical Fischer method involves titration of a sample solution (or suspension) in methanol by a methanolic iodine solution, containing also an excess of $\mathrm{SO}_{2}$ and pyridine $\left(\mathrm{C}_{5} \mathrm{H}_{5} \mathrm{~N}, \mathrm{Py}\right)$ - Fischer reagent. The following reactions occur during the titration:

$$
\begin{aligned}
& \mathrm{SO}_{2}+\mathrm{CH}_{3} \mathrm{OH}+\mathrm{H}_{2} \mathrm{O}+\mathrm{I}_{2} \rightarrow 2 \mathrm{HI}+\mathrm{CH}_{3} \mathrm{OSO}_{3} \mathrm{H} \\
& \mathrm{Py}+\mathrm{HI} \rightarrow \mathrm{PyH}^{+} \mathrm{I}^{-} \\
& \mathrm{Py}+\mathrm{CH}_{3} \mathrm{OSO}_{3} \mathrm{H} \rightarrow \mathrm{PyH}^{+} \mathrm{CH}_{3} \mathrm{OSO}_{3}^{-}
\end{aligned}
$$

lodine content is usually expressed in mg of water reacting with $1 \mathrm{~cm}^{3}$ of the titrant solution (hereunder $\mathrm{T}, \mathrm{mg} \mathrm{cm}^{-3}$ ), which equals the mass of water $(\mathrm{mg})$ reacting with 1.00 $\mathrm{cm}^{3}$ of the iodine solution. T is determined experimentally by titration of a sample with a known water content. The sample may be, for example, a hydrated compound or a standard solution of water in methanol. In the latter case it should be taken into account that methanol itself can contain certain amount of water.

In all calculations please use the atomic masses accurate to 2 decimal points.
4.1 Sometimes titration of water is performed in pyridine medium without methanol. How would the reaction of $\mathrm{I}_{2}$ with $\mathrm{SO}_{2}$ and $\mathrm{H}_{2} \mathrm{O}$ occur in this case? Write down balanced reaction equation.

Calculate the T values of iodine solution in each of the following cases:
$4.212 .20 \mathrm{~cm}^{3}$ of Fischer reagent solution were used for titration of 1.352 g of sodium tartrate dihydrate $\mathrm{Na}_{2} \mathrm{C}_{4} \mathrm{H}_{4} \mathrm{O}_{6} .2 \mathrm{H}_{2} \mathrm{O}$.
4.3 A known amount of water ( 21.537 g ) was placed into a $1.000 \mathrm{dm}^{3}$ volumetric flask which was filled by methanol up to the mark. For titration of $10.00 \mathrm{~cm}^{3}$ of the obtained solution, $22.70 \mathrm{~cm}^{3}$ of Fischer reagent solution were needed, whereas 2.20 $\mathrm{cm}^{3}$ of iodine were used for titration of $25.00 \mathrm{~cm}^{3}$ of methanol.
4.45 .624 g of water were diluted by methanol up to a total volume of $1.000 \mathrm{dm}^{3}$ (solution A); $22.45 \mathrm{~cm}^{3}$ of this solution were used for titration of $15.00 \mathrm{~cm}^{3}$ of a Fischer reagent (solution B).

Then $25.00 \mathrm{~cm}^{3}$ of methanol (of the same batch as used for the preparation of solution A) and $10.00 \mathrm{~cm}^{3}$ of solution B were mixed, and the mixture was titrated by the solution A. $10.79 \mathrm{~cm}^{3}$ of the latter solution were spent.
4.5 An inexperienced analyst tried to determine water content in a sample of CaO using Fischer reagent. Write down the equation(s) of reaction(s) demonstrating possible sources of errors.

For the titration of 0.6387 g of a hydrated compound $\mathrm{Fe}_{2}\left(\mathrm{SO}_{4}\right)_{3} \cdot \mathrm{xH}_{2} \mathrm{O}, 10.59 \mathrm{~cm}^{3}$ of iodine solution ( $T=15.46 \mathrm{mg} / \mathrm{cm}^{3}$ ) were consumed.
4.6 What other reaction(s), beside those given in the problem, can occur during the titration? Write down the equations of two such processes.
4.7 Write down an equation of the overall reaction of $\mathrm{Fe}_{2}\left(\mathrm{SO}_{4}\right)_{3} \cdot \mathrm{x}_{2} \mathrm{O}$ with the Fischer reagent.
4.8 Calculate the composition of the hydrate $\mathrm{Fe}_{2}\left(\mathrm{SO}_{4}\right)_{3} \cdot \mathrm{xH}_{2} \mathrm{O}$ ( $\mathrm{x}=$ integer ).

## SOLUTION

### 4.1 Equation:

$\mathrm{I}_{2}+\mathrm{SO}_{2}+2 \mathrm{H}_{2} \mathrm{O}+4 \mathrm{Py} \rightarrow 2 \mathrm{PyHI}+(\mathrm{PyH})_{2} \mathrm{SO}_{4}$
4.2 T is equal to:
$M\left(\mathrm{Na}_{2} \mathrm{C}_{4} \mathrm{H}_{4} \mathrm{O}_{6} \cdot 2 \mathrm{H}_{2} \mathrm{O}\right)=230.05 \mathrm{~g} \mathrm{~mol}^{-1} \quad 2 \times M\left(\mathrm{H}_{2} \mathrm{O}\right)=36.04 \mathrm{~g} \mathrm{~mol}^{-1}$
$m\left(\mathrm{H}_{2} \mathrm{O}\right)=\frac{1.3520 \times 36.04}{230.05}=0.2118 \mathrm{~g}=211.8 \mathrm{mg}$
$\mathrm{T}=\frac{211.8}{12.20}=17.36 \mathrm{mg} \mathrm{cm}^{-3}$
$\mathrm{T}=17.36 \mathrm{mg} \mathrm{cm}^{-3}$
4.3 T is equal to:

Volume of iodine consumed for $10 \mathrm{~cm}^{3}$ of pure $\mathrm{CH}_{3} \mathrm{OH}=\frac{2.20 \times 10.00}{25.00}=0.88 \mathrm{~cm}^{3}$
$\mathrm{T}=\frac{21.537 \times 0.01 \times 10^{3}}{22.70-0.88}=9.87 \mathrm{mg} \mathrm{cm}^{-3}$

More exactly
$10.00 \mathrm{~cm}^{3}$ of the solution contains $\frac{(1000-21.5) \times 10.00}{1000}=9.785 \mathrm{~cm}^{3}$ of methanol.
Volume of iodine consumed for $9,785 \mathrm{~cm}^{3}$ of pure $\mathrm{CH}_{3} \mathrm{OH}=\frac{2.20 \times 9,785}{25.00}=$
$=0.86 \mathrm{~cm}^{3}$
$\mathrm{T}=\frac{21.537 \times 0.01 \times 10^{3}}{22.70-0.86}=9.86 \mathrm{mg} \mathrm{cm}^{-3}$
$\mathrm{T}=9.87 \mathrm{mg} \mathrm{cm}^{-3}$
4.4 T is equal to:

## Approach 1

Let $1 \mathrm{~cm}^{3}$ of $\mathrm{CH}_{3} \mathrm{OH}$ contains $x \mathrm{mg} \mathrm{H}_{2} \mathrm{O}$, then $1 \mathrm{~cm}^{3}$ of $\mathbf{A}$ contains
[ $(1.000-0.006) x+5.624] \mathrm{mg} \mathrm{H}_{2} \mathrm{O}$.
$15.00 \mathrm{~T}=22.45(0.994 \mathrm{x}+5.624) \quad-1^{\text {st }}$ titration,
$10.00 \mathrm{~T}=25.00 \mathrm{x}+10.79(0.994 \mathrm{x}+5.624) \quad-2^{\text {nd }}$ titration.
Hence, $x=1.13 \mathrm{mg} \mathrm{cm}^{-3}, \mathrm{~T}=10.09 \mathrm{mg} \mathrm{cm}^{-3}$ ( 10.10 without taking into account 0.994 factor)

## Approach 2

Let $\mathrm{y} \mathrm{cm}^{3}$ of $\boldsymbol{B}$ be consumed for the titration of water, contained in $1 \mathrm{~cm}^{3}$ of $\mathrm{CH}_{3} \mathrm{OH}$.
Then $\mathrm{T}=\frac{22.45 \times 5.624}{15.00-22.45 \times 0.994 \times \mathrm{y}}\left(1^{\text {st }}\right.$ titration $)=\frac{10.79 \times 5.624}{10.00-25.00 \mathrm{y}-10.79 \mathrm{y}}$
(2 $2^{\text {nd }}$ titration).
Hence, $\mathrm{y}=0.1116$ and $\mathrm{T}=10.10 \mathrm{mg} \mathrm{cm}^{-3}$
$\mathrm{T}=10.09 \mathrm{mg} \mathrm{cm}^{-3}$ ( 10.10 without taking into account 0.994 factor)
4.5 Equation(s):
$\mathrm{CaO}+\mathrm{SO}_{2} \rightarrow \mathrm{CaSO}_{3}$
$2 \mathrm{CaO}+2 \mathrm{I}_{2} \rightarrow \mathrm{Cal}_{2}+\mathrm{Ca}(\mathrm{Ol})_{2}$
$6 \mathrm{CaO}+6 \mathrm{I}_{2} \rightarrow 5 \mathrm{CaI}_{2}+\mathrm{Ca}\left(\mathrm{IO}_{3}\right)_{2}$
(Instead of $\mathrm{CaO}, \mathrm{Ca}(\mathrm{OH})_{2}$ may be written.)
4.6 Equation(s):
$\mathrm{Fe}_{2}\left(\mathrm{SO}_{4}\right)_{3}+2 \mathrm{HI} \rightarrow 2 \mathrm{FeSO}_{4}+\mathrm{I}_{2}+\mathrm{H}_{2} \mathrm{SO}_{4}$
$\mathrm{Fe}_{2}\left(\mathrm{SO}_{4}\right)_{3}+\mathrm{H}_{2} \mathrm{O}+\mathrm{SO}_{2}+\mathrm{CH}_{3} \mathrm{OH} \rightarrow 2 \mathrm{FeSO}_{4}+\mathrm{CH}_{3} \mathrm{OHSO}_{3}+\mathrm{H}_{2} \mathrm{SO}_{4}$
(or in ionic form)
4.7 Equation:
$\mathrm{Fe}_{2}\left(\mathrm{SO}_{4}\right)_{3} \cdot x \mathrm{H}_{2} \mathrm{O}+(\mathrm{x}-1) \mathrm{I}_{2}+\mathrm{xSO}_{2}+\mathrm{xCH}_{3} \mathrm{OH} \rightarrow 2 \mathrm{FeSO}_{4}+\mathrm{xCH}_{3} \mathrm{OHSO}_{3}+$ $+\mathrm{H}_{2} \mathrm{SO}_{4}+2(x-1) \mathrm{HI}$
4.8 The composition of the crystallohydrate is:
$M\left(\mathrm{Fe}_{2}\left(\mathrm{SO}_{4}\right)_{3} \cdot \mathrm{xH}_{2} \mathrm{O}\right)=399.9+18.02 \mathrm{x}$
$m\left(\mathrm{H}_{2} \mathrm{O}\right)=\frac{0.6387 \times 18.02 \mathrm{x}}{(399.9+18.02 x)}$
$m\left(\mathrm{H}_{2} \mathrm{O}\right)=10.59 \mathrm{~cm}^{3} \times 15.46 \mathrm{mg} \mathrm{cm}^{-3} \times 0.001 \mathrm{~g} \mathrm{mg}^{-1} \times \frac{\mathrm{X}}{\mathrm{x}-1}$
$0.1637 \times(399.9+18.02 x)=11.51 x-11.51$
$x=8.994 \approx 9$
Formula: $\mathrm{Fe}_{2}\left(\mathrm{SO}_{4}\right)_{3} \cdot 9 \mathrm{H}_{2} \mathrm{O}$

# THE FORTIETH <br> INTERNATIONAL CHEMISTRY OLYMPIAD <br> 12-21 JULY 2008, BUDAPEST, HUNGARY 

## THEORETICAL PROBLEMS

## PROBLEM 1

The label on a bottle containing a dilute aqueous solution of an acid became damaged. Only its concentration was readable. A pH meter was nearby, and a quick measurement showed that the hydrogen ion concentration is equal to the value on the label.
1.1 Give the formulae of four acids that could have been in the solution if the pH changed one unit after a tenfold dilution.
1.2 Could it be possible that the dilute solution contained sulfuric acid?

Sulfuric acid: $\quad \mathrm{p} K_{\mathrm{a} 2}=1.99$
$\square$ Yes
$\square$ No
If yes, calculate the pH (or at least try to estimate it) and show your work.
1.3 Could it be possible that the solution contained acetic acid?

Acetic acid: $\quad \mathrm{p} K_{\mathrm{a}}=4.76$
$\square$ Yes
$\square$ No
If yes, calculate the pH (or at least try to estimate it) and show your work.
1.4 Could it be possible that the solution contained EDTA (ethylene diamino tetraacetic acid)? You may use reasonable approximations.
EDTA: $\mathrm{p} K_{\mathrm{a} 1}=1.70, \mathrm{p} K_{\mathrm{a} 2}=2.60, \mathrm{p} K_{\mathrm{a} 3}=6.30, \mathrm{p} K_{\mathrm{a} 4}=10.60$
$\square$ Yes $\square$ No
If yes, calculate the concentration.

## SOLUTION

1.1 Any univalent, strong acid $\left(\mathrm{HCl}, \mathrm{HBr}, \mathrm{HI}, \mathrm{HNO}_{3}, \mathrm{HClO}_{4}\right)$ is acceptable. HF is not!

## 1.2Yes $\square$ No

No, the first dissociation step can be regarded as complete in aqueous solutions, thus $\left[\mathrm{H}^{+}\right]>c_{\text {acid }}$.
No text or calculations are needed.

### 1.3 V YesNo

Yes, but it can happen only in quite dilute solutions.
$c=[\mathrm{HA}]+[\mathrm{A}]=\left[\mathrm{H}^{+}\right]$
$\left[\mathrm{H}^{+}\right]=[\mathrm{A}]+[\mathrm{OH}]$
This means that $[\mathrm{HA}]=[\mathrm{OH}]$
$K=\frac{\left[\mathrm{H}^{+}\right]\left[\mathrm{A}^{-}\right]}{[\mathrm{HA}]}=\frac{\left[\mathrm{H}^{+}\right]\left(\left[\mathrm{H}^{+}\right]-\left[\mathrm{OH}^{-}\right]\right)}{\left[\mathrm{OH}^{-}\right]}=\frac{\left[\mathrm{H}^{+}\right]^{3}}{K_{w}}-\left[\mathrm{H}^{+}\right]$
The pH of the solution must be acidic, but close to 7 .
6.5 is a good guess.

A good approximation is: $\left[\mathrm{H}^{+}\right]=\sqrt[3]{\left(K K_{w}\right)}$
The full equation can be solved through iteration: $\left[\mathrm{H}^{+}\right]=\sqrt[3]{\left(K+\left[\mathrm{H}^{+}\right]\right) K_{\mathrm{w}}}$
Starting with a neutral solution two cycles of iteration give identical results:
$5.64 \times 10^{-7} \mathrm{~mol} \mathrm{dm}^{-3}$ as the required concentration. Exact pH is 6.25 .

### 1.4 VesNo

We can suppose that this solution would be quite acidic, so the $3^{\text {rd }}$ and $4^{\text {th }}$ dissociation steps can be disregarded. The following equations are thus true:
$c=\left[\mathrm{H}_{4} \mathrm{~A}\right]+\left[\mathrm{H}_{3} \mathrm{~A}\right]+\left[\mathrm{H}_{2} \mathrm{~A}^{2-}\right]=\left[\mathrm{H}^{+}\right]$
$\left[\mathrm{H}^{+}\right]=\left[\mathrm{H}_{3} \mathrm{~A}\right]+2\left[\mathrm{H}_{2} \mathrm{~A}^{2}\right]$
This means that $\left[\mathrm{H}_{4} \mathrm{~A}\right]=\left[\mathrm{H}_{2} \mathrm{~A}^{2-}\right]$
$K_{1} K_{2}=\frac{\left[\mathrm{H}^{+}\right]^{2}\left[\mathrm{H}_{2} \mathrm{~A}^{2-}\right]}{\left[\mathrm{H}_{4} \mathrm{~A}\right]}=\left[\mathrm{H}^{+}\right]^{2}$

$$
\left(\text { or } p H=\left(p K_{1}+p K_{2}\right) / 2=2.15\right)
$$

$c=0.0071 \mathrm{~mol} \mathrm{dm}^{-3}$

## PROBLEM 3

The chemical oxygen demand (COD) refers to the amount of oxidizable substance, such as organic compounds, in a sample solution, and it is used as an indication of water quality in seas, lakes, and marshes. For example, the COD of service water is kept below $1 \mathrm{mg} \mathrm{dm}^{-3}$. The COD $\left(\mathrm{mg} \mathrm{dm}^{-3}\right)$ is represented by mass of $\mathrm{O}_{2}(\mathrm{mg})$ which accepts the same amount of electrons which would be accepted by the strong oxidizing agent when $1 \mathrm{dm}^{3}$ of a sample solution is treated with it. An example of the operation is presented below.

## Analytical Operation

A sample solution with a volume of $1.00 \mathrm{dm}^{3}$ was acidified with a sufficient amount of sulphuric acid, and chloride ions were removed by the addition of silver nitrate solution. A volume of $1.00 \cdot 10^{-1} \mathrm{dm}^{3}$ of potassium permanganate solution $\left(c=5.00 \cdot 10^{-3} \mathrm{~mol} \mathrm{dm}^{-3}\right.$ ) was added to the sample solution, and the mixture was heated for 30 min . Further, a volume of $1.00 \cdot 10^{-1} \mathrm{dm}^{3}$ of disodium oxalate $\left(\mathrm{Na}_{2} \mathrm{C}_{2} \mathrm{O}_{4}\right.$ or $\left.\mathrm{NaOOC}-\mathrm{COONa}\right)$ standard solution ( $c=1$. $25 \cdot 10^{-2} \mathrm{~mol} \mathrm{dm}^{-3}$ ) was added, and the mixture was stirred well. Oxalate ions that remained unreacted were titrated with potassium permanganate solution ( $c=$ $5.00 \cdot 10^{-3} \mathrm{~mol} \mathrm{dm}^{-3}$ ). A volume of $3.00 \cdot 10^{-2} \mathrm{dm}^{3}$ of the solution was used for the titration.
3.1 Give the equation of the redox reaction of potassium permanganate and disodium oxalate.
3.2 Calculate the mass of $\mathrm{O}_{2}$ (in mg ) that will oxidize the same number of moles of oxidizable substance as $1.00 \cdot 10^{-3} \mathrm{dm}^{3}$ of potassium permanganate solution with a concentration of $5.00 \cdot 10^{-3} \mathrm{~mol} \mathrm{dm}^{-3}$ does.
3.3 From the following choices, select the most appropriate reason for the removal of chloride ions:
[A] Some of the chloride ions react with potassium permanganate, resulting in an error in COD.
[B] Some of the chloride ions react with disodium oxalate, resulting in an error in COD.
[C] Some of the chloride ions react with organic compounds in the sample solution, resulting in an error in COD.
[D] A colour is developed during titration, resulting in an error in COD.
3.4 Calculate the $\operatorname{COD}\left(\mathrm{mg} \mathrm{dm}^{-3}\right)$ of the sample solution described in the analytical operation above.

## SOLUTION

3.1 $2 \mathrm{KMnO}_{4}+5 \mathrm{Na}_{2} \mathrm{C}_{2} \mathrm{O}_{4}+8 \mathrm{H}_{2} \mathrm{SO}_{4} \rightarrow 2 \mathrm{MnSO}_{4}+5 \mathrm{Na}_{2} \mathrm{SO}_{4}+\mathrm{K}_{2} \mathrm{SO}_{4}+10 \mathrm{CO}_{2}+8 \mathrm{H}_{2} \mathrm{O}$ or
$2 \mathrm{KMnO}_{4}+5 \mathrm{H}_{2} \mathrm{C}_{2} \mathrm{O}_{4}+3 \mathrm{H}_{2} \mathrm{SO}_{4} \rightarrow 2 \mathrm{MnSO}_{4}+\mathrm{K}_{2} \mathrm{SO}_{4}+10 \mathrm{CO}_{2}+8 \mathrm{H}_{2} \mathrm{O}$
or
$2 \mathrm{MnO}_{4}^{-}+5 \mathrm{C}_{2} \mathrm{O}_{4}^{2-}+16 \mathrm{H}^{+} \rightarrow 2 \mathrm{Mn}^{2+}+10 \mathrm{CO}_{2}+8 \mathrm{H}_{2} \mathrm{O}$
3.2 The reactions of potassium permanganate and $\mathrm{O}_{2}$ are as follows:
$\mathrm{MnO}_{4}^{-}+8 \mathrm{H}^{+}+5 \mathrm{e}^{-} \rightarrow \mathrm{Mn}^{2+}+4 \mathrm{H}_{2} \mathrm{O}$
$\mathrm{O}_{2}+4 \mathrm{H}^{+}+4 \mathrm{e}^{-} \rightarrow 2 \mathrm{H}_{2} \mathrm{O}$
$n\left(\mathrm{MnO}_{4}^{-}\right)=1.00 \cdot 10^{-3} \mathrm{dm}^{3} \times 5.00 \cdot 10^{-3} \mathrm{~mol} \mathrm{dm}^{-3}=5.00 \cdot 10^{-6} \mathrm{~mol}$
$n\left(\mathrm{O}_{2}\right)=5.00 \cdot 10^{-6} \mathrm{~mol} \times 5 / 4=6.25 \cdot 10^{-6} \mathrm{~mol}$
$m\left(\mathrm{O}_{2}\right)=6.25 \cdot 10^{-6} \mathrm{~mol} \times 32 \mathrm{~g} \mathrm{~mol}^{-1}=2.00 \cdot 10^{-4} \mathrm{~g}=2.00 \cdot 10^{-1} \mathrm{mg}$
3.3 The correct answer is [A].
3.4 The amounts of electrons used for reduction or oxidation are equal. Then:
$5 \times 5.00 \cdot 10^{-3} \mathrm{~mol} \mathrm{dm}^{-3} \times\left(1.00 \cdot 10^{-1}+\mathrm{A}\right) \mathrm{dm}^{3}=$
$=2 \times 1.25 \cdot 10^{-2} \mathrm{~mol} \mathrm{dm}^{-3} \times 1.00 \cdot 10^{-1} \mathrm{dm}^{3}+\mathrm{X}$
where $\mathrm{A}\left(\mathrm{cm}^{3}\right)$ is an amount of potassium permanganate used for the final titration, and $X(\mathrm{~mol})$ is the amount of electrons for the oxidizable substance.
Equation (1) gives $X=2.50 \cdot 10^{-2} \times \mathrm{A}$.
When $A=3.00 \cdot 10^{-2} \mathrm{dm}^{3}, X=7.50 \cdot 10^{-4} \mathrm{~mol}$.
Hence, $\mathrm{COD}=(32 / 4) \mathrm{g} \mathrm{mol}^{-1} \times 7.50 \cdot 10^{-4} \mathrm{~mol} \times 10^{3}(\mathrm{mg} / \mathrm{g}) \times 1 / 1\left(\mathrm{dm}^{-3}\right)=$
$=6.00 \mathrm{mg} \mathrm{dm}^{-3}$
or

The amount of potassium permanganate consumed by the oxidizable substance, $B\left(\mathrm{~cm}^{3}\right)$, is
$5 \times 5.00 \cdot 10^{-3} \times\left(1.00 \cdot 10^{-1}+A-B\right)=2 \times 1.25 \cdot 10^{-2} \times 1.00 \cdot 10^{-1}$
At $A=3.00 \cdot 10^{-2} \mathrm{dm}^{3} B$ equals to $3.00 \cdot 10^{-2} \mathrm{dm}^{3}$.
From the solution to question 3.2 above

$$
\mathrm{COD}=\frac{2.00 \cdot 10^{-1}}{1.00 \cdot 10^{-3}}\left(\mathrm{mg} \mathrm{dm}{ }^{-3}\right) \times 3.00 \cdot 10^{-2}\left(\mathrm{dm}^{3}\right) \times 1 / 1\left(\mathrm{dm}^{-3}\right)=6.00 \mathrm{mg} \mathrm{dm}^{-3}
$$

## PROBLEM 2

Anhydrous ammonia is an ultra-clean, energy-dense alternative liquid fuel. It produces no greenhouse gases on combustion.

In an experiment, gaseous $\mathrm{NH}_{3}$ is burned with $\mathrm{O}_{2}$ in a container of fixed volume according to the equation given below.

$$
4 \mathrm{NH}_{3}(g)+3 \mathrm{O}_{2}(g) \rightarrow 2 \mathrm{~N}_{2}(g)+6 \mathrm{H}_{2} \mathrm{O}(I)
$$

The initial and final states are at 298 K . After combustion with 14.40 g of $\mathrm{O}_{2}$, some of $\mathrm{NH}_{3}$ remains unreacted.
2.1 Calculate the heat released during the process.

$$
\Delta_{\mathrm{f}} H^{\rho}\left(\mathrm{NH}_{3}(g)\right)=-46.11 \mathrm{~kJ} \mathrm{~mol}^{-1} \text { and } \Delta_{\mathrm{f}} H^{\circ}\left(\mathrm{H}_{2} \mathrm{O}(\Lambda)\right)=-285.83 \mathrm{~kJ} \mathrm{~mol}^{-1}
$$

To determine the amount of $\mathrm{NH}_{3}$ gas dissolved in water, produced during the combustion process, a $10.00 \mathrm{~cm}^{3}$ sample of the aqueous solution was withdrawn from the reaction vessel and added to $15.0 \mathrm{~cm}^{3}$ of a $\mathrm{H}_{2} \mathrm{SO}_{4}$ solution ( $c=0.0100 \mathrm{~mol} \mathrm{dm}^{-3}$ ). The resulting solution was titrated with a standard NaOH solution ( $c=0.0200 \mathrm{~mol} \mathrm{dm}^{-3}$ ) and the equivalence point was reached at $10.64 \mathrm{~cm}^{3}$.

$$
\left(K_{b}\left(\mathrm{NH}_{3}\right)=1.8 \cdot 10^{-5} ; \quad K_{a}\left(\mathrm{HSO}_{4}^{-}\right)=1.1 \cdot 10^{-2}\right)
$$

2.2 Calculate pH of the solution in the container after combustion.
2.3 At the end point of titration, $\mathrm{NH}_{4}^{+}$and $\mathrm{SO}_{4}^{2-}$ ions are present in the solution. Write the equations for the relevant equilibria to show how the presence of these two ions affects the pH and calculate their equilibrium constant(s).
2.4 Tick the correct statement for the pH of the solution at the equivalence point.

- $\mathrm{pH}>7$
$\square \mathrm{pH}=7$
- $\mathrm{pH}<7$

## SOLUTION

$2.1 q_{v}=\Delta E=\Delta H-\Delta n_{\mathrm{g}} R T$
For 1 mole of $\mathrm{NH}_{3}$ :
$\Delta H=3 / 2 \times(-285.83)-(-46.11)=-382.64 \mathrm{~kJ}$
$\Delta n_{\mathrm{g}}=-1.25 \mathrm{~mol}$
$\Delta E=-382.64 \mathrm{~kJ}-\left[(-1.25 \mathrm{~mol}) \times 8.314 \mathrm{~J} \mathrm{~mol}^{-1} \mathrm{~K}^{-1} \times 298 \mathrm{~K}\right]=-379.5 \mathrm{~kJ}$
$n\left(\mathrm{O}_{2}\right)=\frac{14.4 \mathrm{~g}}{32.0 \mathrm{~g} \mathrm{~mol}^{-1}}=0.450 \mathrm{~mol}$
$n\left(\mathrm{NH}_{3}\right)_{\text {reacted }}=0.450 \mathrm{~mol} \times 4 / 3=0.600 \mathrm{~mol}$
$q_{v}=\Delta E=0.600 \mathrm{~mol} \times\left(-379.5 \mathrm{~kJ} \mathrm{~mol}^{-1}\right)=\underline{-227.7 \mathrm{~kJ}}$
2.2 Total $n\left(\mathrm{H}_{2} \mathrm{SO}_{4}\right)=15.00 \mathrm{~cm}^{3} \times 0.0100 \mathrm{~mol} \mathrm{dm}^{-3}=0.150 \mathrm{mmol}$
$\mathrm{H}_{2} \mathrm{SO}_{4}+2 \mathrm{NaOH} \rightarrow \mathrm{Na}_{2} \mathrm{SO}_{4}+2 \mathrm{H}_{2} \mathrm{O}$
After back titration with NaOH :

$$
\begin{aligned}
n\left(\mathrm{H}_{2} \mathrm{SO}_{4}\right)_{\text {reacted }} & =1 / 2 n(\mathrm{NaOH})_{\text {reacted }}=1 / 2\left(0.01064 \mathrm{dm}^{3} \times 0.0200 \mathrm{~mol} \mathrm{dm}^{-3}\right)= \\
& =1.064 \cdot 10^{-4} \mathrm{~mol}=0.1064 \mathrm{mmol}
\end{aligned}
$$

$n\left(\mathrm{H}_{2} \mathrm{SO}_{4}\right)$ reacted with $\mathrm{NH}_{3}=0.0436 \mathrm{mmol}$
$2 \mathrm{NH}_{3}+\mathrm{H}_{2} \mathrm{SO}_{4} \rightarrow\left(\mathrm{NH}_{4}\right)_{2} \mathrm{SO}_{4}$
$n\left(\mathrm{NH}_{3}\right)=2 \times n\left(\mathrm{H}_{2} \mathrm{SO}_{4}\right)$ reacted with $\mathrm{NH}_{3}=2 \times 0.0436 \mathrm{mmol}=0.0872 \mathrm{mmol}$
$c\left(\mathrm{NH}_{3}\right)=\frac{0.0872 \mathrm{mmol}}{0.0100 \mathrm{dm}^{3}}=8.72 \cdot 10^{-3} \mathrm{~mol} \mathrm{dm}^{-3}$
$\mathrm{NH}_{3}(a q)+\mathrm{H}_{2} \mathrm{O}(I) \rightleftarrows \mathrm{NH}_{4}^{+}(a q)+\mathrm{OH}^{-}(a q)$
$c-x \quad x \quad x$
$K_{b}=1.8 \cdot 10^{-5}=\frac{x^{2}}{0.00872-x}$
$x=\left[\mathrm{OH}^{-}\right]=3.96 \cdot 10^{-4}$
$p O H=3.41$
$p H=10.59$
$2.3 \mathrm{SO}_{4}^{2-}(a q)+\mathrm{H}_{2} \mathrm{O}(I) \rightleftarrows \mathrm{HSO}_{4}^{-}(a q)+\mathrm{OH}^{-}(a q)$

$$
\begin{aligned}
& K_{b}=\frac{K_{w}}{K_{a}}=\frac{1.0 \cdot 10^{-14}}{1.1 \cdot 10^{-2}}=9.1 \cdot 10^{-13} \\
& \mathrm{NH}_{4}^{+}(a q)+\mathrm{H}_{2} \mathrm{O}(I) \rightleftarrows \mathrm{NH}_{3}(a q)+\mathrm{H}_{3} \mathrm{O}^{+}(a q) \\
& K_{a}=\frac{K_{w}}{K_{b}}=\frac{1.0 \cdot 10^{-14}}{1.8 \cdot 10^{-5}}=5.6 \cdot 10^{-10}
\end{aligned}
$$

2.4 The correct answer: $\mathrm{pH}<7.0$

## PROBLEM 6

Extraction of gold using sodium cyanide, a very poisonous chemical, causes environmental problems and gives rise to serious public concern about the use of this so called "cyanide process". Thiosulfate leaching of gold has been considered as an alternative. In this process, the main reagent is ammonium thiosulfate, $\left(\mathrm{NH}_{4}\right)_{2} \mathrm{~S}_{2} \mathrm{O}_{3}$, which is relatively non-toxic. Although this process appears to be environmentally benign, the chemistry involved is very complex and needs to be studied thoroughly. The solution used for leaching gold contains $\mathrm{S}_{2} \mathrm{O}_{3}^{2-}, \mathrm{Cu}^{2+}, \mathrm{NH}_{3}$, and dissolved $\mathrm{O}_{2}$. The solution must have a pH greater than 8.5 to allow free ammonia to be present.

According to the proposed mechanism, a local voltaic micro-cell is formed on the surface of gold particles during the leaching process and operates as follows:
Anode:
$\mathrm{Au}(s)+2 \mathrm{NH}_{3}(a q) \rightarrow\left[\mathrm{Au}\left(\mathrm{NH}_{3}\right)_{2}\right]^{+}(a q)+e^{-}$
$\left[\mathrm{Au}\left(\mathrm{NH}_{3}\right)_{2}\right]^{+}(\mathrm{aq})+2 \mathrm{~S}_{2} \mathrm{O}_{3}^{2-}(\mathrm{aq}) \rightarrow\left[\mathrm{Au}\left(\mathrm{S}_{2} \mathrm{O}_{3}\right)_{2}\right]^{3-}(\mathrm{aq})+2 \mathrm{NH}_{3}(\mathrm{aq})$

## Cathode:

$\left[\mathrm{Cu}\left(\mathrm{NH}_{3}\right)_{4}\right]^{2+}(a q)+e^{-} \rightarrow\left[\mathrm{Cu}\left(\mathrm{NH}_{3}\right)_{2}\right]^{+}(a q)+2 \mathrm{NH}_{3}(a q)$
$\left[\mathrm{Cu}\left(\mathrm{NH}_{3}\right)_{2}\right]^{+}(a q)+3 \mathrm{~S}_{2} \mathrm{O}_{3}^{2-}(\mathrm{aq}) \rightarrow\left[\mathrm{Cu}\left(\mathrm{S}_{2} \mathrm{O}_{3}\right)_{3}\right]^{5-}(a q)+2 \mathrm{NH}_{3}(a q)$
6.1 Write the overall cell reaction for this voltaic cell.
6.2 In the presence of ammonia $\left[\mathrm{Cu}\left(\mathrm{S}_{2} \mathrm{O}_{3}\right)_{3}\right]^{5-}$ is oxidized by $\mathrm{O}_{2}$ back to $\left[\mathrm{Cu}\left(\mathrm{NH}_{3}\right)_{4}\right]^{2+}$. Write a balanced equation for this oxidation-reduction reaction in basic solution.
6.3 In this leaching process, the $\left[\mathrm{Cu}\left(\mathrm{NH}_{3}\right)_{4}\right]^{2+}$ complex ion functions as catalyst and speeds up the dissolution of gold. Write the net overall oxidation-reduction reaction for dissolution of the gold metal, which is catalyzed by $\left[\mathrm{Cu}\left(\mathrm{NH}_{3}\right)_{4}\right]^{2+}$ complex ion.
6.4 Draw the coordination geometries of the metal in $\left[\mathrm{Au}\left(\mathrm{NH}_{3}\right)_{2}\right]^{+}$and $\left[\mathrm{Au}\left(\mathrm{S}_{2} \mathrm{O}_{3}\right)_{2}\right]^{3-}$ complex ions, indicating the coordinating atoms.

The formation constants, $K_{f}$, of $\left[\mathrm{Au}\left(\mathrm{NH}_{3}\right)_{2}\right]^{+}$and $\left[\mathrm{Au}\left(\mathrm{S}_{2} \mathrm{O}_{3}\right)_{2}\right]^{3-}$ complexes are $1.00 \cdot 10^{26}$ and $1.00 \cdot 10^{28}$, respectively. Consider a leaching solution in which the equilibrium concentrations of the species are as follows:
$\left[\mathrm{S}_{2} \mathrm{O}_{3}^{2-}\right]=0.100 ;\left[\mathrm{NH}_{3}\right]=0.100$ and the total concentration of gold $(\mathrm{I})$ species $=$ $5.50 \cdot 10^{-5} \mathrm{~mol} \mathrm{dm}^{-3}$.
6.5 Calculate the percentage of gold $(\mathrm{I})$ ion that exists in the form of thiosulfate complex.

When the concentration of $\mathrm{O}_{2}$ is not high enough and $\mathrm{pH}>10, \mathrm{~S}_{2} \mathrm{O}_{3}^{2-}$ reduces $\left[\mathrm{Cu}\left(\mathrm{NH}_{3}\right)_{4}\right]^{2+}$ to $\left[\mathrm{Cu}\left(\mathrm{S}_{2} \mathrm{O}_{3}\right)_{3}\right]^{5-}$ with the formation of tetrathionate ion $\mathrm{S}_{4} \mathrm{O}_{6}^{2-}$ :
$2\left[\mathrm{Cu}\left(\mathrm{NH}_{3}\right)_{4}\right]^{2+}(a q)+8 \mathrm{~S}_{2} \mathrm{O}_{3}^{2-}(\mathrm{aq}) \rightarrow 2\left[\mathrm{Cu}\left(\mathrm{S}_{2} \mathrm{O}_{3}\right)_{3}\right]^{5-}(a q)+\mathrm{S}_{4} \mathrm{O}_{6}^{2-}(a q)+8 \mathrm{NH}_{3}(a q)$
In basic solution tetrathionate disproportionates to trithionate, $\mathrm{S}_{3} \mathrm{O}_{6}^{2-}$, and thiosulfate.
6.6 Write a balanced equation for this disproportionation reaction.
6.7 When the $\mathrm{O}_{2}$ concentration is too high, $\mathrm{S}_{2} \mathrm{O}_{3}^{2-}$ is oxidized by oxygen to yield trithionate and sulfate ions. Write a balanced equation for this reaction.

## SOLUTION

6.1 Net anode half reaction:

$$
\mathrm{Au}(s)+2 \mathrm{~S}_{2} \mathrm{O}_{3}^{2-}(\mathrm{aq}) \rightarrow\left[\mathrm{Au}\left(\mathrm{~S}_{2} \mathrm{O}_{3}\right)_{2}\right]^{3-}(\mathrm{aq})+e^{-}
$$

Net cathode half reaction:
$\left[\mathrm{Cu}\left(\mathrm{NH}_{3}\right)_{4}\right]^{2+}(a q)+3 \mathrm{~S}_{2} \mathrm{O}_{3}^{2-}(a q)+e^{-} \rightarrow\left[\mathrm{Cu}\left(\mathrm{S}_{2} \mathrm{O}_{3}\right)_{3}\right]^{5-}(a q)+4 \mathrm{NH}_{3}(a q)$
erall cell reaction:

$$
\begin{aligned}
\mathrm{Au}(\mathrm{~s})+\left[\mathrm{Cu}\left(\mathrm{NH}_{3}\right)_{4}\right]^{2+}(a q)+5 \mathrm{~S}_{2} \mathrm{O}_{3}^{2-}(a q) \rightarrow & {\left[\mathrm{Au}\left(\mathrm{~S}_{2} \mathrm{O}_{3}\right)_{2}\right]^{3-}(a q)+\left[\mathrm{Cu}\left(\mathrm{~S}_{2} \mathrm{O}_{3}\right)_{3}\right]^{5-}(a q) } \\
& +4 \mathrm{NH}_{3}(a q)
\end{aligned}
$$

6.2 Oxidation half reaction:
$\left[\mathrm{Cu}\left(\mathrm{S}_{2} \mathrm{O}_{3}\right)_{3}\right]^{5-}(a q)+4 \mathrm{NH}_{3}(a q) \rightarrow\left[\mathrm{Cu}\left(\mathrm{NH}_{3}\right)_{4}\right]^{2+}(a q)+3 \mathrm{~S}_{2} \mathrm{O}_{3}^{2-}(a q)+e^{-}$
Reduction half reaction:
$\mathrm{O}_{2}(g)+2 \mathrm{H}_{2} \mathrm{O}(\Lambda)+4 \mathrm{e}^{-} \rightarrow 4 \mathrm{OH}^{-}(a q)$
Redox reaction:

$$
\begin{aligned}
4\left[\mathrm{Cu}\left(\mathrm{~S}_{2} \mathrm{O}_{3}\right)_{3}\right]^{5-}(\mathrm{aq})+16 & \mathrm{NH}_{3}(\mathrm{aq})+\mathrm{O}_{2}(g)+2 \mathrm{H}_{2} \mathrm{O}(\Lambda) \rightarrow \\
& \rightarrow 4\left[\mathrm{Cu}\left(\mathrm{NH}_{3}\right)_{4}\right]^{2+}(\mathrm{aq})+12 \mathrm{~S}_{2} \mathrm{O}_{3}^{2-}(\mathrm{aq})+4 \mathrm{OH}^{-}(\mathrm{aq})
\end{aligned}
$$

6.3 $\mathrm{Au}(s)+\left[\mathrm{Cu}\left(\mathrm{NH}_{3}\right)_{4}\right]^{2+}(\mathrm{aq})+5 \mathrm{~S}_{2} \mathrm{O}_{3}^{2-}(a q) \rightarrow\left[\mathrm{Au}\left(\mathrm{S}_{2} \mathrm{O}_{3}\right)_{2}\right]^{3-}(a q)+\left[\mathrm{Cu}\left(\mathrm{S}_{2} \mathrm{O}_{3}\right)_{3}\right]^{5-}(a q)+$ $+4 \mathrm{NH}_{3}(a q)$

$$
\begin{aligned}
& 4\left[\mathrm{Cu}\left(\mathrm{~S}_{2} \mathrm{O}_{3}\right)_{3}\right]^{5-}(\mathrm{aq})+16 \mathrm{NH}_{3}(\mathrm{aq})+\mathrm{O}_{2}(g)+2 \mathrm{H}_{2} \mathrm{O}(\Lambda) \rightarrow \\
& \rightarrow 4\left[\mathrm{Cu}\left(\mathrm{NH}_{3}\right)_{4}\right]^{2+}(\mathrm{aq})+12 \mathrm{~S}_{2} \mathrm{O}_{3}^{2-}(\mathrm{aq})+4 \mathrm{OH}^{-}(\mathrm{aq})
\end{aligned}
$$

Summarizing the above equations:
$4 \mathrm{Au}(s)+8 \mathrm{~S}_{2} \mathrm{O}_{3}^{2-}(\mathrm{aq})+\mathrm{O}_{2}(g)+2 \mathrm{H}_{2} \mathrm{O}(\Omega) \rightarrow 4\left[\mathrm{Au}\left(\mathrm{S}_{2} \mathrm{O}_{3}\right)_{2}\right]^{3-}(\mathrm{aq})+4 \mathrm{OH}^{-}(\mathrm{aq})$

## 6.4

6.5 $\mathrm{Au}^{+}(\mathrm{aq})+2 \mathrm{NH}_{3}(\mathrm{aq}) \rightarrow\left[\mathrm{Au}\left(\mathrm{NH}_{3}\right)_{2}\right]^{+}(\mathrm{aq})$
$K_{f, 1}=1.00 .10^{26}$
$\mathrm{Au}^{+}(\mathrm{aq})+2 \mathrm{~S}_{2} \mathrm{O}_{3}{ }^{2-}(\mathrm{aq}) \rightarrow\left[\mathrm{Au}\left(\mathrm{S}_{2} \mathrm{O}_{3}\right)_{2}\right]^{3-}(a q)$
$K_{f, 2}=1.00 \cdot 10^{28}$
$\left[\mathrm{Au}\left(\mathrm{NH}_{3}\right)_{2}\right]^{+}(\mathrm{aq})+2 \mathrm{~S}_{2} \mathrm{O}_{3}^{2-}(\mathrm{aq}) \rightarrow\left[\mathrm{Au}\left(\mathrm{S}_{2} \mathrm{O}_{3}\right)_{2}\right]^{3-}(\mathrm{aq})+2 \mathrm{NH}_{3}(\mathrm{aq})$
$K_{\text {eq }}=\frac{K_{f, 2}}{K_{f, 1}}=1.00 \cdot 10^{2}$
$\left[\mathrm{Au}\left(\mathrm{NH}_{3}\right)_{2}\right]^{+}+\left[\mathrm{Au}\left(\mathrm{S}_{2} \mathrm{O}_{3}\right)_{2}\right]^{3-}=5.50 \cdot 10^{-5} \mathrm{~mol} \mathrm{dm}{ }^{-3}$
$K_{\text {eq }}=\frac{(0.100)^{2} x}{\left(5.50 \cdot 10^{-5}-x\right)(0.100)^{2}}=1.00 \cdot 10^{2}$
$x=5.445 \cdot 10^{-5}$
$\frac{5.445 \cdot 10^{-5}}{5.50 \cdot 10^{-5}} \times 100=99.0 \%$
Thus, $99.0 \%$ of $\mathrm{Au}(\mathrm{I})$ is in the form of $\left[\mathrm{Au}\left(\mathrm{S}_{2} \mathrm{O}_{3}\right)_{2}\right]^{3-}$.
$6.6 \mathrm{~S}_{4} \mathrm{O}_{6}^{2-}(\mathrm{aq})+2 e^{-} \rightarrow 2 \mathrm{~S}_{2} \mathrm{O}_{3}^{2-}(a q)$
$12 \mathrm{OH}^{-}(a q)+3 \mathrm{~S}_{4} \mathrm{O}_{6}^{2-}(a q) \rightarrow 4 \mathrm{~S}_{3} \mathrm{O}_{6}^{2-}(a q)+6 \mathrm{H}_{2} \mathrm{O}(\Lambda)+10 e^{-}$
$\qquad$
$4 \mathrm{~S}_{4} \mathrm{O}_{6}^{2-}(a q)+6 \mathrm{OH}^{-}(a q) \rightarrow 5 \mathrm{~S}_{2} \mathrm{O}_{3}^{2-}(a q)+2 \mathrm{~S}_{3} \mathrm{O}_{6}^{2-}(a q)+3 \mathrm{H}_{2} \mathrm{O}(\Lambda)$
disproportionation
$6.72 \mathrm{~S}_{2} \mathrm{O}_{3}^{2-}(a q)+2 \mathrm{O}_{2}(g) \rightarrow \mathrm{SO}_{4}^{2-}(a q)+\mathrm{S}_{3} \mathrm{O}_{6}^{2-}(a q)$

## PROBLEM 3

Thiomolybdate ions are derived from molybdate ions, $\mathrm{MoO}_{4}^{2-}$, by replacing oxygen atoms with sulfur atoms. In nature, thiomolybdate ions are found in such places as the deep waters of the Black Sea, where biological sulfate reduction generates $\mathrm{H}_{2} \mathrm{~S}$. The molybdate to thiomolybdate transformation leads to rapid loss of dissolved Mo from seawater to underlying sediments, depleting the ocean in Mo, a trace element essential for life.

The following equilibria control the relative concentrations of molybdate and thiomolybdate ions in dilute aqueous solution:

$$
\begin{array}{ll}
\mathrm{MoS}_{4}^{2-}+\mathrm{H}_{2} \mathrm{O}(\mathrm{I}) \rightleftharpoons \mathrm{MoOS}_{3}^{2-}+\mathrm{H}_{2} \mathrm{~S}(\mathrm{aq}) & K_{1}=1.3 \cdot 10^{-5} \\
\mathrm{MoOS}_{3}^{2-}+\mathrm{H}_{2} \mathrm{O}(\mathrm{I}) \rightleftharpoons \mathrm{MoO}_{2} \mathrm{~S}_{2}^{2-}+\mathrm{H}_{2} \mathrm{~S}(\mathrm{aq}) & K_{2}=1.0 \cdot 10^{-5} \\
\mathrm{MoO}_{2} \mathrm{~S}_{2}^{2-}+\mathrm{H}_{2} \mathrm{O}(\mathrm{I}) \rightleftharpoons \mathrm{MoO}_{3} \mathrm{~S}^{2-}+\mathrm{H}_{2} \mathrm{~S}(\mathrm{aq}) & K_{3}=1.6 \cdot 10^{-5} \\
\mathrm{MoO}_{3} \mathrm{~S}^{2-}+\mathrm{H}_{2} \mathrm{O}(\mathrm{I}) \rightleftharpoons \mathrm{MoO}_{4}^{2-}+\mathrm{H}_{2} \mathrm{~S}(\mathrm{aq}) & K_{4}=6.5 \cdot 10^{-6}
\end{array}
$$

3.1 If at equilibrium the concentrations of $\mathrm{MoO}_{4}^{2-}$ and $\mathrm{H}_{2} \mathrm{~S}(\mathrm{aq})$ are equal to $1 \cdot 10^{-7}$ and $1 \cdot 10^{-6}$, respectively, what would be the equilibrium concentration of $\mathrm{MoS}_{4}^{2-}$ ?

Solutions containing $\mathrm{MoO}_{2} \mathrm{~S}_{2}^{2-}, \mathrm{MoOS}_{3}^{2-}$ and $\mathrm{MoS}_{4}^{2-}$ display absorption peaks in the visible wavelength range at 395 and 468 nm . The other ions, as well as $\mathrm{H}_{2} \mathrm{~S}$, absorb negligibly in the visible wavelength range. The molar absorptivities $(\varepsilon)$ at these two wavelengths are given in the following table:

|  | $\varepsilon$ at 468 nm <br> $\mathrm{dm}^{3} \mathrm{~mol}^{-1} \mathrm{~cm}^{-1}$ | $\varepsilon$ at 395 nm <br> $\mathrm{dm}^{3} \mathrm{~mol}^{-1} \mathrm{~cm}^{-1}$ |
| :---: | :---: | :---: |
| $\mathrm{MoS}_{4}^{2-}$ | 11870 | 120 |
| $\mathrm{MoOS}_{3}^{2-}$ | 0 | 9030 |
| $\mathrm{MoO}_{2} \mathrm{~S}_{2}^{2-}$ | 0 | 3230 |

3.2 A solution not at equilibrium contains a mixture of $\mathrm{MoS}_{4}^{2-}, \mathrm{MoOS}_{3}^{2-}$ and $\mathrm{MoO}_{2} \mathrm{~S}_{2}^{2-}$ and no other Mo-containing species. The total concentration of all species containing Mo is $6.0 \cdot 10^{-6} \mathrm{~mol} \mathrm{dm}^{-3}$. In a 10.0 cm absorption cell, the absorbance of the solution at 468 nm is 0.365 and that at 395 nm is 0.213 . Calculate the concentrations of all three Mo-containing anions in this mixture.

A solution with initial concentration of $\mathrm{MoS}_{4}^{2-}$ equal to $2.0 \cdot 10^{-7} \mathrm{~mol} \mathrm{dm}{ }^{-3}$ hydrolyzes in a closed system. The $\mathrm{H}_{2} \mathrm{~S}$ product accumulates until equilibrium is reached. When calculating the final equilibrium concentrations of $\mathrm{H}_{2} \mathrm{~S}(\mathrm{aq})$, and all five Mo-containing anions (that is, $\mathrm{MoO}_{4}^{2-}, \mathrm{MoOS}_{3}^{2-}, \mathrm{MoO}_{2} \mathrm{~S}_{2}^{2-}, \mathrm{MoOS}_{3}{ }^{2-}$ and $\mathrm{MoS}_{4}^{2-}$ ) ignore the possibility that $\mathrm{H}_{2} \mathrm{~S}$ might ionize to $\mathrm{HS}^{-}$under certain pH conditions.
3.3 Write the six independent equations that determine the system.
3.4 Calculate the above mentioned six concentrations making reasonable approximations, giving your answers to two significant figures.

## SOLUTION

3.1 Multiplying the mass action laws for the four given reactions produces:
$\frac{\left[\mathrm{MoO}_{4}^{2-}\right]\left[\mathrm{H}_{2} \mathrm{~S}\right]^{4}}{\left[\mathrm{MoS}_{4}^{2-}\right]}=\frac{1 \cdot 10^{-7}\left(1 \cdot 10^{-6}\right)^{4}}{\left[\mathrm{MoS}_{4}^{2-}\right]}=1.4 \cdot 10^{-20}$
$\left[\mathrm{MoS}_{4}^{2-}\right]=7 \cdot 10^{-12}$
3.2 $\mathrm{MoS}_{4}^{2-}$ concentration is determined by absorbance at 468 nm :
$0.365=11870 \times 10.0 \times c\left(\mathrm{MoS}_{4}^{2-}\right)$
$C\left(\mathrm{MoS}_{4}^{2-}\right)=3.08 \cdot 10^{-6} \mathrm{~mol} \mathrm{dm}^{-3}$
From conservation of Mo:

$$
\begin{aligned}
c\left(\mathrm{MoOS}_{3}^{2-}\right)+c\left(\mathrm{MoO}_{2} \mathrm{~S}_{2}^{2-}\right) & =c(\mathrm{Mo})_{\text {Total }}-c\left(\mathrm{MoS}_{4}^{2-}\right)= \\
& =\left(6.0 \cdot 10^{-6}-3.08 \cdot 10^{-6}\right) \mathrm{mol} \mathrm{dm}
\end{aligned}=2.9 \cdot 10^{-6} \mathrm{~mol} \mathrm{dm}^{-3} .
$$

By rearrangement:
$c\left(\mathrm{MoO}_{2} \mathrm{~S}_{2}^{2-}\right)=2.9 \cdot 10^{-6} \mathrm{~mol} \mathrm{dm}^{-3}-c\left(\mathrm{MoOS}_{3}^{2-}\right)$

From optical absorbance at 395 nm (quantities in the equations are without dimensions):

$$
\begin{aligned}
& 0.213=\left(120 \times 10.0 \times 3.08 \cdot 10^{-6}\right)+\left(9030 \times 10.0 \times c\left(\mathrm{MoOS}_{3}^{2-}\right)\right)+ \\
&+\left(3230 \times 10.0 \times c\left(\mathrm{MoO}_{2} \mathrm{~S}_{2}^{2-}\right)\right) \\
& 0.213=\left(120 \times 10.0 \times 3.08 \cdot 10^{-6}\right)+\left(9030 \times 10.0 \times c\left(\mathrm{MoOS}_{3}^{2-}\right)\right)+ \\
&+(3230)(10.0)\left(2.9 \cdot 10^{-6}-c\left(\mathrm{MoOS}_{3}^{2-}\right)\right) \\
& c\left(\mathrm{MoOS}_{3}^{2-}\right)=2.0 \cdot 10^{-6} \mathrm{~mol} \mathrm{dm}^{-3} \\
& c\left(\mathrm{MoO}_{2} \mathrm{~S}_{2}^{2-}\right)=2.9 \cdot 10^{-6}-c\left(\mathrm{MoOS}_{3}^{2-}\right)=0.9 \cdot 10^{-6} \mathrm{~mol} \mathrm{dm}^{-3}
\end{aligned}
$$

3.3 Mass balance for Mo:

$$
\begin{equation*}
2.0 \cdot 10^{-7}=c\left(\mathrm{MoS}_{4}^{2-}\right)+c\left(\mathrm{MoOS}_{3}^{2-}\right)+c\left(\mathrm{MoO}_{2} \mathrm{~S}_{2}^{2-}\right)+c\left(\mathrm{MoO}_{3} \mathrm{~S}^{2-}\right)+c\left(\mathrm{MoO}_{4}^{2-}\right) \tag{1}
\end{equation*}
$$

Mass balance for S :
$8.0 \cdot 10^{-7}=4 c\left(\mathrm{MoS}_{4}^{2-}\right)+3 c\left(\mathrm{MoOS}_{3}^{2-}\right)+2 c\left(\mathrm{MoO}_{2} \mathrm{~S}_{2}^{2-}\right)+c\left(\mathrm{MoO}_{3} \mathrm{~S}^{2-}\right)+\left(\mathrm{H}_{2} \mathrm{~S}\right)$

Equilibrium constants:
$1.3 \cdot 10^{-5}=\frac{\left[\mathrm{MoOS}_{3}^{2-}\right]\left[\mathrm{H}_{2} \mathrm{~S}\right]}{\left[\mathrm{MoS}_{4}^{2-}\right]}$
$1.0 \cdot 10^{-5}=\frac{\left[\mathrm{MoO}_{2} \mathrm{~S}_{2}{ }^{2-}\right]\left[\mathrm{H}_{2} \mathrm{~S}\right]}{\left[\mathrm{MoOS}_{3}^{2-}\right]}$
$1.6 \cdot 10^{-5}=\frac{\left[\mathrm{MoO}_{3} \mathrm{~S}^{2-}\right]\left[\mathrm{H}_{2} \mathrm{~S}\right]}{\left[\mathrm{MoO}_{2} \mathrm{~S}_{2}^{2-}\right]}$
$6.5 \cdot 10^{-6}=\frac{\left[\mathrm{MoO}_{4}^{2-}\right]\left[\mathrm{H}_{2} \mathrm{~S}\right]}{\left[\mathrm{MoO}_{3} \mathrm{~S}^{2-}\right]}$
3.4 It is likely that multiple approaches will be found for solving these equations. Here is one approach:
The maximum possible $\mathrm{H}_{2} \mathrm{~S}$ concentration is $8.0 \cdot 10^{-7} \mathrm{~mol} \mathrm{dm}^{-3}$ if complete hydrolysis occurs. At this $\mathrm{H}_{2} \mathrm{~S}$ concentration, $\mathrm{MoO}_{3} \mathrm{~S}^{2-}$ is only about $12 \%$ of $c\left(\mathrm{MoO}_{4}^{2-}\right)$ and the remaining thio anions are much less abundant. Because the problem justifies a solution that is precise only to two significant figures, the mass balance equations can be truncated as follows:
$2.0 \cdot 10^{-7}=\left[\mathrm{MoO}_{3} \mathrm{~S}^{2-}\right]+\left[\mathrm{MoO}_{4}^{2-}\right] \quad$ (Mo mass balance)
$8.0 \cdot 10^{-7}=\left[\mathrm{MoO}_{3} \mathrm{~S}^{2-}\right]+\left[\mathrm{H}_{2} \mathrm{~S}\right] \quad$ (S mass balance)
Subtracting the first from the second equation and rearranging gives:
$\left[\mathrm{MoO}_{4}^{2-}\right]=\left[\mathrm{H}_{2} \mathrm{~S}\right]-6.0 \cdot 10^{-7}$
Likewise, the $S$ mass balance can be rearranged,
$\left[\mathrm{MoO}_{3} \mathrm{~S}^{2}\right]=8.0 \cdot 10^{-7}-\left[\mathrm{H}_{2} \mathrm{~S}\right]$
Employing the equilibrium constant for the reaction involving $\mathrm{MoO}_{4}^{2-}$ and $\mathrm{MoO}_{3} \mathrm{~S}^{2-}$ :
$6.5 \cdot 10^{-6}=\frac{\left[\mathrm{MoO}_{4}^{2-}\right]\left[\mathrm{H}_{2} \mathrm{~S}\right]}{\left[\mathrm{MoO}_{3} \mathrm{~S}^{2-}\right]}=\frac{\left(\left[\mathrm{H}_{2} \mathrm{~S}\right]-6.0 \cdot 10^{-7}\right)\left[\mathrm{H}_{2} \mathrm{~S}\right]}{8.0 \cdot 10^{-7}-\left[\mathrm{H}_{2} \mathrm{~S}\right]}$
Rearrangement and solution by the quadratic formula gives $\left(\mathrm{H}_{2} \mathrm{~S}\right)$. Back substitution gives the remaining concentrations.
Results:
$\begin{array}{lll}{\left[\mathrm{H}_{2} \mathrm{~S}\right]=7.8 \cdot 10^{-7} ;} & {\left[\mathrm{MoO}_{4}^{2-}\right]=1.8 \cdot 10^{-7} ;} & {\left[\mathrm{MoO}_{3} \mathrm{~S}^{2-}\right]=2.1 \cdot 10^{-8} ;} \\ {\left[\mathrm{MoO}_{2} \mathrm{~S}_{2}^{2-}\right]=1.0 \cdot 10^{-9} ;} & {\left[\mathrm{MoOS}_{3}^{2-}\right]=8.1 \cdot 10^{-11} ;} & {\left[\mathrm{MoS}_{4}^{2-}\right]=4.9 \cdot 10^{-12} .}\end{array}$

## PROBLEM 7

## Diverse permanganatometry

The amount of many reducing agents can be determined by permanganatometric titration in alkaline medium allowing permanganate ion reduction to manganate.
7.1 Write down the ionic reaction equation for titration of formate with permanganate in an aqueous NaOH solution with a concentration of $\sim 0.5 \mathrm{~mol} \mathrm{dm}^{-3}$.

Titration with permanganate in alkaline medium is often supplemented by addition of a barium salt, which leads to precipitation of manganate as $\mathrm{BaMnO}_{4}$.
7.2 Which side redox processes involving manganate is suppressed by the barium salt? Write down an example of equation of the corresponding reaction.

A volume of $10.00 \mathrm{~cm}^{3}\left(V_{\mathrm{Mn}}\right)$ of $\mathrm{KMnO}_{4}$ solution with a concentration of 0.0400 $\mathrm{mol} \mathrm{dm}{ }^{-3}\left(c_{\mathrm{Mn}}\right)$ was placed in each of flasks $\mathbf{A}, \mathbf{B}$, and $\mathbf{C}$ and different reactions were conducted in each flask.

A sample solution containing crotonic acid (CA) $\mathrm{CH}_{3}-\mathrm{CH}=\mathrm{CH}-\mathrm{COOH}$, an alkali and barium nitrate (both in an excess) were added to flask A, and the reaction mixture was incubated for 45 min . It is known that crotonic acid loses 10 electrons under the experiment conditions.

## 7.3 a Write down the total ionic equation for the reaction.

A volume of $8.00 \mathrm{~cm}^{3}\left(V_{\mathrm{CN}}\right)$ of potassium cyanide solution ( $c_{\mathrm{CN}}=0.0100 \mathrm{~mol} \mathrm{dm}^{-3}$ ) was then added to the incubated mixture. This resulted in completion of the following reaction:

$$
2 \mathrm{Ba}^{2+}+2 \mathrm{MnO}_{4}^{-}+\mathrm{CN}^{-}+2 \mathrm{OH}^{-} \rightarrow 2 \mathrm{BaMnO}_{4}+\mathrm{CNO}^{-}+\mathrm{H}_{2} \mathrm{O}
$$

$\mathrm{BaMnO}_{4}$ precipitate was then filtered off, and the excess of cyanide in the filtrate was titrated with $\mathrm{AgNO}_{3}$ solution ( $c_{\mathrm{Ag}}=0.0050 \mathrm{~mol} \mathrm{dm}{ }^{-3}$ ) till detectable precipitation was observed. Note that both $\mathrm{CN}^{-}$and $\mathrm{CNO}^{-}$are analogs of halide ions, but $\mathrm{CNO}^{-}$affords soluble silver salt.
7.3 b Give the formula for the complex formed when $\mathrm{Ag}^{+}$ions were initially added to the cyanide solution (until the precipitate was formed).
7.3 c Give the formula of the precipitate formed.

## 7.3 d Derive the formula for calculating the amount of substance of crotonic acid in the sample solution. Calculate the mass of crotonic acid (in mg ) if $5.40 \mathrm{~cm}^{3}\left(V_{\mathrm{Ag}}\right)$ of the silver salt solution was consumed for the titration to the endpoint.

Another sample of crotonic acid and alkali (in an excess) were added to flask B, this mixture lacking barium salt. An excess of KI (instead of cyanide) was added as a reducing agent. The mixture was then acidified and the iodine evolved was titrated with a thiosulfate solution $\left(c_{S}=0.1000 \mathrm{~mol} \mathrm{dm}^{-3}\right) .4 .90 \mathrm{~cm}^{3}\left(V_{\mathrm{S} 1}\right)$ of the titrant was used to reach the endpoint.
7.4 Derive the formula for calculating the amount of substance of crotonic acid in this experiment. Calculate the mass of crotonic acid (in mg).

A sample containing tin(II) was added to flask $\mathbf{C}$, and the medium was adjusted to weak alkaline. Tin(II) was quantitatively oxidized to $\mathrm{Sn}(\mathrm{OH})_{6}{ }^{2-}$, whereas a precipitate formed as a result of permanganate reduction. The precipitate was isolated, washed off, dried at $250{ }^{\circ} \mathrm{C}$, weighed (the mass of the water-free precipitate ( $m_{\text {prec }}$ ), representing a binary compound, was of 28.6 mg ), and dissolved in $\mathrm{H}_{2} \mathrm{SO}_{4}$ in the presence of an excess of potassium iodide. The evolved iodine was titrated with 0.1000 M thiosulfate solution. $2.5 \mathrm{~cm}^{3}\left(V_{\mathrm{S} 2}\right)$ of the latter was consumed to attain the endpoint.
7.5 a Write down the reaction of precipitation. Confirm it with calculations.
7.5 b Calculate the mass of tin in the sample (in mg ) referred to the metal.

## SOLUTION

$7.12 \mathrm{MnO}_{4}^{-}+\mathrm{HCOO}^{-}+3 \mathrm{OH}^{-} \rightarrow 2 \mathrm{MnO}_{4}^{2-}+\mathrm{CO}_{3}^{2-}+2 \mathrm{H}_{2} \mathrm{O}$
$7.2 \mathrm{MnO}_{4}^{2-}+2 \mathrm{H}_{2} \mathrm{O}+2 \mathrm{e}^{-} \rightarrow \mathrm{MnO}_{2}+4 \mathrm{OH}^{-}$
or
$3 \mathrm{MnO}_{4}^{2-}+2 \mathrm{H}_{2} \mathrm{O} \rightarrow \mathrm{MnO}_{2}+2 \mathrm{MnO}_{4}^{-}+4 \mathrm{OH}^{-}$
7.3 a $\quad \mathrm{C}_{4} \mathrm{H}_{5} \mathrm{O}_{2}^{-}+10 \mathrm{MnO}_{4}^{-}+14 \mathrm{OH}^{-}+12 \mathrm{Ba}^{2+} \rightarrow$

$$
\rightarrow 10 \mathrm{BaMnO}_{4}+\mathrm{CH}_{3} \mathrm{COO}^{-}+2 \mathrm{BaCO}_{3}+8 \mathrm{H}_{2} \mathrm{O}
$$

7.3 b Before the endpoint was attained:
$\left[\mathrm{Ag}(\mathrm{CN})_{2}\right]^{-}$
7.3 c After the endpoint:

$$
\mathrm{Ag}^{+}+\mathrm{Ag}(\mathrm{CN})_{2}^{-}=\mathrm{Ag}\left[\mathrm{Ag}(\mathrm{CN})_{2}\right] \downarrow \text { or } \mathrm{Ag}^{+}+\mathrm{CN}^{-}=\mathrm{AgCN} \downarrow
$$

Thus: $\operatorname{Ag}\left[\mathrm{Ag}(\mathrm{CN})_{2}\right]$ or AgCN is the correct answer.
7.3 d Permanganate left after the reaction with crotonic acid: $c_{\mathrm{Mn}} V_{\mathrm{Mn}}-10 n_{\mathrm{CA}}$ (mmol). Cyanide consumed for the residual permanganate: $1 / 2\left(c_{\mathrm{Mn}} V_{\mathrm{Mn}}-10 n_{\mathrm{CA}}\right)$ (mmol). Cyanide excess: $c_{\mathrm{CN}} V_{\mathrm{CN}}-1 / 2\left(c_{\mathrm{Mn}} V_{\mathrm{Mn}}-10 n_{\mathrm{CA}}\right)$

For the correct silver-cyanide stoichiometry (1:2):
$2 c_{\mathrm{Ag}} V_{\mathrm{Ag}}=c_{\mathrm{CN}} V_{\mathrm{CN}}-1 / 2\left(c_{\mathrm{Mn}} V_{\mathrm{Mn}}-10 n_{\mathrm{CA}}\right)$.
Thus: $n_{\mathrm{CA}}=\frac{2 c_{\mathrm{Ag}} V_{\mathrm{Ag}}-c_{\mathrm{CN}} V_{\mathrm{CN}}+1 / 2 c_{\mathrm{Mn}} V_{\mathrm{Mn}}}{5}$
$n_{\mathrm{CA}}=\frac{2 \times 0.005 \times 5.40-0.0100 \times 8.00+0.5 \times 0.0400 \times 10.00}{5}=0.0348 \mathrm{mmol}$,
Then:
$m_{\mathrm{CA}}=0.0348 \times 86.09=3.00 \mathrm{mg} \quad\left(M_{\mathrm{CA}}=86.09 \mathrm{~g} \mathrm{~mol}^{-1}\right)$.

For the wrong silver-cyanide stoichiometry (1:1):
$c_{\mathrm{Ag}} V_{\mathrm{Ag}}=c_{\mathrm{CN}} V_{\mathrm{CN}}-1 / 2\left(c_{\mathrm{Mn}} V_{\mathrm{Mn}}-10 n_{\mathrm{CA}}\right)$

$$
\begin{aligned}
& n_{\mathrm{CA}}=\frac{c_{\mathrm{Ag}} V_{\mathrm{Ag}}-c_{\mathrm{CN}} V_{\mathrm{CN}}+1 / 2 c_{\mathrm{Mn}} V_{\mathrm{Mn}}}{5} \\
& n_{\mathrm{CA}}=\frac{0.005 \times 5.40-0.0100 \times 8.00+0.5 \times 0.0400 \times 10.00}{5}=0.0290 \mathrm{mmol}
\end{aligned}
$$

Then:
$m_{C A}=0.0290 \times 86.09=2.49 \mathrm{mg}$

### 7.4 Schematically:

$10 \mathrm{MnO}_{4}^{-}+1$ Crotonate $\rightarrow 10 \mathrm{MnO}_{4}^{2-}+$ products
Permanganate left after the reaction with crotonic acid: $c_{\mathrm{Mn}} V_{\mathrm{Mn}}-10 n_{\mathrm{CA}}$ (mmol)
Manganate formed: $10 n_{\mathrm{CA}}$ (mmol)
Reactions occurred after iodide addition:
$2 \mathrm{MnO}_{4}^{-}+10 \mathrm{I}^{-}+16 \mathrm{H}^{+} \rightarrow 2 \mathrm{Mn}^{2+}+5 \mathrm{I}_{2}+8 \mathrm{H}_{2} \mathrm{O}$ and
$\mathrm{MnO}_{4}^{2-}+4 \mathrm{I}^{-}+8 \mathrm{H}^{+} \rightarrow \mathrm{Mn}^{2+}+2 \mathrm{I}_{2}+4 \mathrm{H}_{2} \mathrm{O}$
Amount of substance of the iodine evolved $\left(\mathrm{mmol}_{2}\right)$ :

$$
\begin{aligned}
& 2.5 n_{\mathrm{KMnO}_{4} \text { left }}+2 n_{\mathrm{K}_{2} \mathrm{MnO}_{4}}=2.5\left(c_{\mathrm{Mn}} V_{\mathrm{Mn}}-10 n_{\mathrm{CA}}\right)+2 \times 10 n_{\mathrm{CA}} \\
& 2 \mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3}+\mathrm{I}_{2}=\mathrm{Na}_{2} \mathrm{~S}_{4} \mathrm{O}_{6}+2 \mathrm{NaI} \\
& n_{\mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3}}=2 n_{\mathrm{l}_{2}}=5\left(c_{\mathrm{Mn}} V_{\mathrm{Mn}}-10 n_{\mathrm{CA}}\right)+40 n_{\mathrm{CA}}
\end{aligned}
$$

Thus:
$5\left(c_{\mathrm{Mn}} V_{\mathrm{Mn}}-10 n_{\mathrm{CA}}\right)+40 n_{\mathrm{CA}}=c_{\mathrm{S}} V_{\mathrm{S} 1}$,
and
$n_{C A}=1 / 2 c_{M n} V_{M n}-0.1 c_{S} V_{S 1}$
$n_{C A}=(0.5 \times 0.0400 \times 10.00)-(0.1 \times 0.1000 \times 4.90)=0.151 \mathrm{mmol}$,
$m_{C A}=n_{C A} M_{C A}=13.00 \mathrm{mg}$.
7.5 a Oxidation of tin(II) with permanganate in weak alkaline medium led to an insoluble binary manganese compound. Drying conditions suggest it is either one of manganese oxides or their mixture.

The amount of equivalent is just the same for thiosulfate, iodine and the precipitate.
$n_{\text {eq }}=V_{\mathrm{s} 2} c_{\mathrm{s}}=0.1000 \times 2.5=0.25 \mathrm{mmol}$
$M_{\text {eq }}=28.6 \mathrm{mg} / 0.25 \mathrm{mmol}=114.4 \mathrm{~g} \mathrm{~mol}^{-1}$.
This is the so called molar mass of the equivalent of the precipitate.
Let us consider possible cases.

- If $\mathrm{MnO}_{2}$ was formed
(scheme: $\mathrm{MnO}_{4}^{-}+\mathrm{Sn}^{2+} \rightarrow \mathrm{MnO}_{2} \downarrow+\mathrm{Sn}^{4+}$ )
$\mathrm{MnO}_{2}+4 \mathrm{H}^{+}+2 \mathrm{I}^{-} \rightarrow \mathrm{I}_{2}+\mathrm{Mn}^{2+}+2 \mathrm{H}_{2} \mathrm{O}$,
$\mathrm{I}_{2}+2 \mathrm{~S}_{2} \mathrm{O}_{3}^{2-} \rightarrow 2 \mathrm{I}^{-}+\mathrm{S}_{4} \mathrm{O}_{6}^{2-}$
The molar mass of its equivalent in the reaction with iodide would be: $86.94 / 2=43.47 \mathrm{~g} \mathrm{~mol}^{-1}$.
- If $\mathrm{Mn}_{2} \mathrm{O}_{3}$ was formed $\left(\mathrm{Mn}_{2} \mathrm{O}_{3}+2 \mathrm{I}^{-}+6 \mathrm{H}^{+} \rightarrow \mathrm{I}_{2}+2 \mathrm{Mn}^{2+}+3 \mathrm{H}_{2} \mathrm{O}\right)$, the molar mass of its equivalent in the reaction with iodide would be: $157.88 / 4=78.9 \mathrm{~g} \mathrm{~mol}^{-1}$.
- In the experiment, the molar mass of the equivalent is even higher, thus manganese compounds not oxidizing iodide, can be present in the precipitate, i. e. manganese(II). The only possible variant is manganese(II, III) oxide $\left(\mathrm{Mn}_{3} \mathrm{O}_{4}+2 \mathrm{I}^{-}+8 \mathrm{H}^{+} \rightarrow \mathrm{I}_{2}+3 \mathrm{Mn}^{2+}+4 \mathrm{H}_{2} \mathrm{O}\right)$. The molar mass of the latter: $228.9 / 2=114.4 \mathrm{~g} \mathrm{~mol}^{-1}$.

Reaction:
$6 \mathrm{MnO}_{4}^{-}+13\left[\mathrm{Sn}(\mathrm{OH})_{4}\right]^{2-}+16 \mathrm{H}_{2} \mathrm{O} \rightarrow 2 \mathrm{Mn}_{3} \mathrm{O}_{4} \downarrow+13\left[\mathrm{Sn}(\mathrm{OH})_{6}\right]^{2-}+6 \mathrm{OH}^{-}$
7.5 b Amount of substance of tin equals $13 / 2$ of that of $\mathrm{Mn}_{3} \mathrm{O}_{4}$, or

$$
\begin{aligned}
& n_{\mathrm{Sn}}=28.6 / 228.9 \times 13 / 2=0.812 \mathrm{mmol} \\
& m_{\mathrm{Sn}}=96.4 \mathrm{mg} .
\end{aligned}
$$

## Problem 5. Acid-base Equilibria in Water

A solution (X) contains two weak monoprotic acids (those having one acidic proton); HA with the acid dissociation constant of $K_{H A}=1.74 \times 10^{-7}$, and HB with the acid dissociation constant of $K_{H B}=1.34 \times 10^{-7}$. The solution $\mathbf{X}$ has a pH of 3.75 .

1. Titration of 100 mL solution $\mathbf{X}$ requires 100 mL of 0.220 M NaOH solution for completion.
Calculate the initial (total) concentration ( $\mathrm{mol} \cdot \mathrm{L}^{-1}$ ) of each acid in the solution $\mathbf{X}$. Use reasonable approximations where appropriate. [ $K_{\mathrm{W}}=1.00 \times 10^{-14}$ at 298 K .]

## Problem 5. Acid-base Equilibria in Water

A solution ( $\mathbf{X}$ ) contains two weak monoprotic acids (those having one acidic proton); HA with the acid dissociation constant of $K_{H A}=1.74 \times 10^{-7}$, and HB with the acid dissociation constant of $K_{H B}=1.34 \times 10^{-7}$. The solution $\mathbf{X}$ has a pH of 3.75 .

1. Titration of 100 mL solution $\mathbf{X}$ requires 100 mL of 0.220 M NaOH solution for completion.
Calculate the initial (total) concentration ( $\mathrm{mol} \cdot \mathrm{L}^{-1}$ ) of each acid in the solution $\mathbf{X}$. Use reasonable approximations where appropriate. [ $K_{\mathrm{W}}=1.00 \times 10^{-14}$ at 298 K.$\left.\right]$

Solution: In solution $\mathbf{X}, \mathrm{H}^{+}$was produced from the reactions :

$$
\mathbf{H A} \leftrightharpoons \mathbf{H}^{+}+\mathbf{A}^{-} \quad \text { and } \quad \mathbf{H B} \leftrightharpoons \mathbf{H}^{+}+\mathbf{B}^{-} \quad \text { and } \quad \mathbf{H}_{2} \mathbf{O} \leftrightharpoons \mathbf{H}^{+}+\mathbf{O H}^{-}
$$

The positive and negative charges in an aqueous solution must balance. Thus the charge balance expression is:

$$
\begin{equation*}
\left[\mathrm{OH}^{-}\right]+\left[\mathrm{A}^{-}\right]+\left[\mathrm{B}^{-}\right]=\left[\mathrm{H}^{+}\right] \tag{Eq.1}
\end{equation*}
$$

In the acidic solution $(\mathrm{pH}=3.75),\left[\mathrm{OH}^{-}\right]$can be neglected, so:

$$
\begin{equation*}
\left[\mathrm{A}^{-}\right]+\left[\mathrm{B}^{-}\right]=\left[\mathrm{H}^{+}\right] \tag{Eq.2}
\end{equation*}
$$

From equilibrium expression: $\frac{\left[H^{+}\right] \times\left[A^{-}\right]}{[H A]}=K_{H A}$
and $\quad[\mathrm{HA}]=[\mathrm{HA}]_{\mathrm{i}}-\left[\mathrm{A}^{-}\right]$(where $[H A]_{i}$ is the initial concentration)
So: $\left.\left[H^{+}\right] \times\left[A^{-}\right]=K_{H A} \times[H A]=K_{H A}\left([H A]_{i}-\left[A^{-}\right]\right)\right)$
Thus, the equilibrium concentration of [ $\mathrm{A}^{-}$] can be presented as:
$\left[A^{-}\right]=\frac{K_{H A} \times[H A]_{i}}{K_{H A}+\left[H^{+}\right]}$
Similarly, the equilibrium concentration of $\left[\mathrm{B}^{-}\right]$can be presented as:
$\left[B^{-}\right]=\frac{K_{H B} \times[H B]_{i}}{K_{H B}+\left[H^{+}\right]}$
Substitute equilibrium concentrations of $\left[\mathrm{A}^{-}\right]$and $\left[\mathrm{B}^{-}\right]$into Eq.2:

$$
\frac{K_{H A} \times[H A]_{i}}{K_{H A}+\left[H^{+}\right]}+\frac{K_{H B} \times[H B]_{i}}{K_{H B}+\left[H^{+}\right]}=\left[H^{+}\right]
$$

Since $K_{H A}, K_{H B}$ are much smaller than $\left[\mathrm{H}^{+}\right]$, thus:
$\frac{K_{H A} \times[H A]_{i}}{\left[H^{+}\right]}+\frac{K_{H B} \times[H B]_{i}}{\left[H^{+}\right]}=\left[H^{+}\right]$
or $1.74 \times 10^{-7} \times[\mathrm{HA}]_{\mathrm{i}}+1.34 \times 10^{-7} \times[\mathrm{HB}]_{\mathrm{i}}=\left[\mathrm{H}^{+}\right]^{2}=\left(10^{-3.75}\right)^{2}$
$1.74 \times[\mathrm{HA}]_{\mathrm{i}}+1.34 \times[\mathrm{HB}]_{\mathrm{i}}=0.316$
Neutralization reactions show:

$\mathrm{n}_{\mathrm{HA}}+\mathrm{n}_{\mathrm{HB}}=\mathrm{n}_{\mathrm{NaOH}}$
or $\left([\mathrm{HA}]_{\mathrm{i}}+[\mathrm{HB}]_{\mathrm{i}}\right) \times 0.1 \mathrm{~L}=0.220 \mathrm{M} \times 0.1 \mathrm{~L}$
$[\mathrm{HA}]_{\mathrm{i}}+[\mathrm{HB}]_{\mathrm{i}}=0.220 \mathrm{M}$
Solving Eq. 3 and Eq. 4 gives: $\quad[\mathrm{HA}]_{\mathrm{i}}=0.053 \mathrm{M}$ and $[\mathrm{HB}]_{\mathrm{i}}=0.167 \mathrm{M}$
Concentration of HA $=0.053 \mathbf{M}$
Concentration of $\mathrm{HB}=0.167 \mathrm{M}$
2. Calculate the pH of the solution $\mathbf{Y}$ which initially contains $6.00 \times 10^{-2} \mathrm{M}$ of NaA and $4.00 \times 10^{-2} \mathrm{M}$ of NaB .

## Solution:

Solution Y contains NaA 0.06 M and NaB 0.04 M . The solution is basic, $\mathrm{OH}^{-}$was produced from the reactions:
$\mathrm{NaA}+\mathrm{H}_{2} \mathrm{O} \leftrightharpoons \mathrm{HA}+\mathrm{OH}^{-} \quad K_{b, A}=K_{w} / K_{H A}=5.75 \times 10^{-8}$
$\mathrm{NaB}+\mathrm{H}_{2} \mathrm{O} \leftrightharpoons \mathrm{HB}+\mathrm{OH}^{-} \quad K_{b, B}=K_{w} / K_{H B}=7.46 \times 10^{-8}$
$\mathrm{H}_{2} \mathrm{O} \leftrightharpoons \mathrm{H}^{+}+\mathrm{OH}^{-} \quad K_{w}=1.0010^{-14}$
and we have:
$\left[\mathrm{H}^{+}\right]+[\mathrm{HA}]+[\mathrm{HB}]=\left[\mathrm{OH}^{-}\right]$
In the basic solution, $\left[\mathrm{H}^{+}\right]$can be neglected, so:
$[\mathrm{HA}]+[\mathrm{HB}]=\left[\mathrm{OH}^{-}\right]$
From equilibrium expression: $\quad \frac{\left[O H^{-}\right] \times[H A]}{\left[A^{-}\right]}=K_{b, A}$
and $\quad\left[\mathrm{A}^{-}\right]=0.06-[\mathrm{HA}]$
1 pt
Thus, the equilibrium concentration of HA can be presented as: $[H A]=\frac{K_{b, A} \times 0.06}{K_{b . A}+\left[\mathrm{OH}^{-}\right]}$
Similarly, the equilibrium concentration of HB can be presented as: $[H B]=\frac{K_{b, B} \times 0.04}{K_{b . B}+\left[O H^{-}\right]}$
Substitute equilibrium concentrations of HA and HB into Eq. 6:
$\frac{K_{b, A} \times 0.06}{K_{b . A}+\left[\mathrm{OH}^{-}\right]}+\frac{K_{b, B} \times 0.04}{K_{b . B}+\left[\mathrm{OH}^{-}\right]}=\left[\mathrm{OH}^{-}\right]$
Assume that $K_{b, A}$ and $K_{b, B}$ are much smaller than $\left[\mathrm{OH}^{-}\right]\left({ }^{*}\right)$, thus:
$\left[\mathrm{OH}^{-}\right]^{2}=5.75 \times 10^{-8} \times 0.06+7.46 \times 10^{-8} \times 0.04$
$\left[\mathrm{OH}^{-}\right]=8.02 \times 10^{-5}$ (the assumption $(*)$ is justified)
So $\quad \mathbf{p O H}=4.10$ and $\mathbf{p H}=\mathbf{9 . 9 0}$
1 point
3. Adding large amounts of distilled water to solution $\mathbf{X}$ gives a very (infinitely) dilute solution where the total concentrations of the acids are close to zero. Calculate the percentage of dissociation of each acid in this dilute solution.

Solution: HA in the dilute solution:
$\left[\mathrm{A}^{-}\right]=\alpha \times[\mathrm{HA}]_{\mathrm{i}}$
$[\mathrm{HA}]=(1-\alpha) \times[\mathrm{HA}]_{\mathrm{i}}$
$\left[\mathrm{H}^{+}\right]=10^{-7}$
Substitute these equilibrium concentrations into $K_{H A}$ expression:

$$
\frac{10^{-7} \times \alpha \times[H A]_{i}}{(1-\alpha) \times[H A]_{i}}=K_{H A} \quad \text { or } \quad \frac{10^{-7} \times \alpha}{(1-\alpha)}=1.74 \times 10^{-7}
$$

Solving the equation gives: $\alpha=0.635$
Similarly, for $\mathrm{HB}: \quad \frac{10^{-7} \times \alpha}{(1-\alpha)}=1.34 \times 10^{-7}$

Solving the equation gives: $\alpha=0.573$

- The percentage of dissociation of $\mathrm{HA}=\mathbf{6 5 . 5} \%$
- The percentage of dissociation of $\mathrm{HB}=\mathbf{5 7 . 3} \%$

2 points
4. A buffer solution is added to solution $\mathbf{Y}$ to maintain a pH of 10.0. Assume no change in volume of the resulting solution $\mathbf{Z}$.
Calculate the solubility (in $\mathrm{mol} \cdot \mathrm{L}^{-1}$ ) of a subtancce $\mathrm{M}(\mathrm{OH})_{2}$ in $\mathbf{Z}$, given that the anions $\mathrm{A}^{-}$and $\mathrm{B}^{-}$can form complexes with $\mathrm{M}^{2+}$ :
$\mathrm{M}(\mathrm{OH})_{2} \leftrightharpoons \mathrm{M}^{2+}+2 \mathrm{OH}^{-}$

$$
K_{s p}=3.10 \times 10^{-12}
$$

$\mathrm{M}^{2+}+\mathrm{A}^{-} \leftrightharpoons[\mathrm{MA}]^{+}$
$K_{l}=2.1 \times 10^{3}$
$[\mathrm{MA}]^{+}+\mathrm{A}^{-} \leftrightharpoons\left[\mathrm{MA}_{2}\right]$
$K_{2}=5.0 \times 10^{2}$
$\mathrm{M}^{2+}+\mathrm{B}^{-} \leftrightharpoons[\mathrm{MB}]^{+}$
$K_{1}^{\prime}=6.2 \times 10^{3}$
$[\mathrm{MB}]^{+}+\mathrm{B}^{-} \leftrightharpoons\left[\mathrm{MB}_{2}\right]$
$K^{\prime}{ }_{2}=3.3 \times 10^{2}$

Solution:

$$
\begin{array}{ll}
\mathrm{M}(\mathrm{OH})_{2} \leftrightharpoons \mathrm{M}^{2+}+2 \mathrm{OH}^{-} & \mathrm{K}_{\mathrm{sp}}=3.10 \times 10^{-12} \\
\mathrm{H}_{2} \mathrm{O} \leftrightharpoons \mathrm{H}^{+}+\mathrm{OH}^{-} & \mathrm{K}_{\mathrm{w}}=1.00 \times 10^{-14} \\
\mathrm{M}^{2+}+\mathrm{A}^{-} \leftrightharpoons[\mathrm{MA}]^{+} & \mathrm{K}_{1}=2.10 \times 10^{3} \\
{[\mathrm{MA}]^{+}+\mathrm{A}^{-} \leftrightharpoons\left[\mathrm{MA}_{2}\right]} & \mathrm{K}_{2}=5.00 \times 10^{2} \\
\mathrm{M}^{2+}+\mathrm{B}^{-} \leftrightharpoons\left[\mathrm{MB}^{+}\right. & \mathrm{K}_{1}=6.20 \times 10^{3} \\
{[\mathrm{MB}]^{+}+\mathrm{B}^{-} \leftrightharpoons\left[\mathrm{MB}_{2}\right]} & \mathrm{K}_{2}=3.30 \times 10^{2} \\
\begin{array}{ll}
\text { Solubility of } \mathrm{M}(\mathrm{OH})_{2}=\mathrm{s}=\left[\mathrm{M}^{2+}\right]+\left[\mathrm{MA}^{+}\right]+\left[\mathrm{MA}_{2}\right]+\left[\mathrm{MB}^{+}\right]+\left[\mathrm{MB}_{2}\right] \\
\mathrm{pH} \text { of } \mathbf{Z}=10.0 & \\
\\
{\left[\mathrm{M}^{2+}\right]=\frac{K_{s p}}{\left[O H^{-}\right]^{2}}=\frac{3.10 \times 10^{-12}}{\left(10^{-4}\right)^{2}}=3.10 \times 10^{-4} \mathrm{M}} & \\
\\
\mathrm{At} \mathrm{pH}^{2}=10.0 & \text { Eq. } 1 \\
{\left[A^{-}\right]_{\text {total }}=\frac{K_{H A} \times 0.06}{\left(K_{H A}+10^{-10}\right)}=0.06} & \\
{\left[\mathrm{MA}^{+}\right]=K_{l}\left[\mathrm{M}^{2+}\right]\left[\mathrm{A}^{-}\right]=2.1 \times 10^{3} \times 3.10 \times 10^{-4} \times[\mathrm{A}]=0.651 \times[\mathrm{A}]} & \text { Eq. } 3 \\
{\left[\mathrm{MA}_{2}\right]=K_{l} K_{2}\left[\mathrm{M}^{2+}\right]\left[\mathrm{A}^{-}\right]^{2}=325.5 \times[\mathrm{A}]^{2}} & \text { Eq. } 4 \\
{\left[\mathrm{~A}_{\text {total }}=\left[\mathrm{A}^{-}\right]+\left[\mathrm{MA}^{+}\right]+2 \times\left[\mathrm{MA}_{2}\right]=0.06 \mathrm{M}\right.} & \text { Eq. } 5
\end{array}
\end{array}
$$

Substitute Eq. 3 and Eq. 4 into Eq. 5:
$\left[\mathrm{A}^{-}\right]+0.651 \times\left[\mathrm{A}^{-}\right]+2 \times 325.5 \times\left[\mathrm{A}^{2}\right]^{2}=0.06$

Solve this equation: $\left[\mathrm{A}^{-}\right]=8.42 \times 10^{-3} \mathrm{M}$
Substitute this value into Eq. 3 and Eq. 4:
$\left[\mathrm{MA}^{+}\right]=0.651 \times\left[\mathrm{A}^{-}\right]=\mathbf{5 . 4 8} \times \mathbf{1 0}^{-\mathbf{3}} \mathbf{M}$
$\left[\mathrm{MA}_{2}\right]=325.5 \times[\mathrm{A}]^{2}=\mathbf{2 . 3 1} \times \mathbf{1 0}^{\mathbf{- 2}} \mathbf{~ M}$
Similarly,
$\left[\mathrm{B}^{-}\right]_{\text {total }}=0.04 \mathrm{M}$
$\left[M B^{+}\right]=K_{1}^{\prime}\left[M^{2+}\right]\left[B^{-}\right]=6.2 \times 10^{3} \times 3.10 \times 10^{-4} \times\left[B^{-}\right]=1.92 \times\left[B^{-}\right] \quad$ Eq. 6
$\left[M B_{2}\right]=K_{1}^{\prime} K_{2}^{\prime}\left[M^{2+}\right]\left[B^{-}\right]^{2}=634.3 \times\left[B^{-}\right]^{2} \quad$ Eq. 7
$[B]_{\text {total }}=\left[\mathrm{B}^{-}\right]+\left[\mathrm{MB}^{+}\right]+2 \times\left[\mathrm{MB}_{2}\right]=0.04 \mathrm{M} \quad$ Eq. 8
Substitute Eq. 6 and Eq. 7 into Eq. 8:
$\left[\mathrm{B}^{-}\right]+1.92 \times\left[\mathrm{B}^{-}\right]+2 \times 634.3 \times[\mathrm{B}]^{2}=0.04$
Solve this equation: $\left[\mathrm{B}^{-}\right]=\mathbf{4 . 5 8} \times \mathbf{1 0}^{-\mathbf{3}} \mathrm{M}$
Substitute this value into Eq. 6 and Eq. 7:
$\left[\mathrm{MB}^{+}\right]=1.92 \times\left[\mathrm{B}^{-}\right]=\mathbf{8 . 7 9} \times \mathbf{1 0}^{-\mathbf{3}} \mathbf{M}$
$\left[\mathrm{MB}_{2}\right]=634.3 \times\left[\mathrm{B}^{-}\right]^{2}=\mathbf{1 . 3 3} \times \mathbf{1 0}^{\mathbf{- 2}} \mathbf{~ M}$
Thus, solubility of $\mathrm{M}(\mathrm{OH})_{2}$ in $\mathbf{Z}$ is $\mathbf{s}^{\prime}$
$\mathbf{s}^{\prime}=3.10 \times 10^{-4}+5.48 \times 10^{-3}+2.31 \times 10^{-2}+8.79 \times 10^{-3}+1.33 \times 10^{-2}=\mathbf{5 . 1 0} \times \mathbf{1 0}^{-\mathbf{2}} \mathbf{M}$
Answer: Solubility of $\mathbf{M}(\mathrm{OH})_{2}$ in $\mathrm{Z}=5.10 \times 10^{-2} \mathrm{M}$.

## Problem 3. Two binding centers - competition or cooperation?

## (7 points)

| Question | 1 |  | 2 |  |  |  | Total |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 1.1 | 1.2 | 2.1 | 2.2 | 2.3 | 2.4 |  |
| Marks | 3 | 2 | 8 | 3 | 6 | 6 | $\mathbf{2 8}$ |

Many chemical reactions in living organisms include the formation of "host-guest" complexes where the host molecule reversibly binds one or several guest molecules. Consider a host molecule $\boldsymbol{H}$ with two binding centers - say, $a$ and $b$ which have different affinities for the guest molecules $\boldsymbol{G}$ :

$$
\begin{aligned}
\boldsymbol{H}+\boldsymbol{G} & \rightleftarrows \boldsymbol{H G}_{\boldsymbol{a}}
\end{aligned} \quad K_{a}=\frac{\left[\boldsymbol{H} \boldsymbol{G}_{a}\right]}{[\boldsymbol{H}][\boldsymbol{G}]}-1 . K_{b}=\frac{\left[\boldsymbol{H} \boldsymbol{G}_{b}\right]}{[\boldsymbol{H}][\boldsymbol{G}]} \quad K_{b} \neq K_{a} .
$$

where $\boldsymbol{H} \boldsymbol{G}_{\mathbf{a}}$ and $\boldsymbol{H} \boldsymbol{G}_{\mathbf{b}}$ denote a complex where guest is bound to $a$ center and $b$ center, respectively. $K_{a}$ and $K_{b}$ are the binding constants for the centers $a$ and $b$, brackets denote molar concentrations.

Attachment of one $\boldsymbol{G}$ molecule to $\boldsymbol{H}$ can change the binding ability of the second centre. This change is described by the "interaction factor" $\beta$ which reflects the influence of one binding center on another and is defined as follows:

$$
\boldsymbol{H} \boldsymbol{G}_{a}+\boldsymbol{G} \rightleftarrows \boldsymbol{H} \boldsymbol{G}_{\mathbf{2}} \quad \frac{\left[\boldsymbol{H G _ { 2 }}\right]}{\left[\boldsymbol{H G _ { a }}\right][\boldsymbol{G}]}=\beta K_{b}
$$

where $\boldsymbol{H G}_{\mathbf{2}}$ is the completely bound complex.
1.1. Determine the range of values (or one value, if necessary) of $\beta$ which correspond to three possible ways of interaction between binding centers: a) cooperation (binding by one center facilitates subsequent binding); b) competition (first binding complicates the second); c) independence (no interaction).

Cooperation:

Competition:

Independence:
$47^{\text {th }}$ International Chemistry Olympiad. Baku, Azerbaijan, July 20-29, 2015. ABC-1
1.2. Find the equilibrium constant for the process: $\boldsymbol{H} \boldsymbol{G}_{\boldsymbol{b}}+\boldsymbol{G} \rightleftarrows \boldsymbol{H} \boldsymbol{G}_{\mathbf{2}}$ in terms of binding constant(s) and interaction factor.

Calculations:

$$
K=
$$

2.1. The solution was prepared with the initial concentrations $[\boldsymbol{H}]_{0}=1 \mathrm{M}$ and $[\boldsymbol{G}]_{0}=2 \mathrm{M}$. After the reactions were completed, the concentration of $\boldsymbol{H}$ decreased by 10 times and that of $\boldsymbol{G}$ by 4 times. For these host and guest, $K_{b}=2 K_{a}$. Determine the concentrations of all other species in the solution and find the binding constant $K_{a}$ and the factor $\beta$.

Calculations:

$$
\begin{array}{ll}
{\left[H \boldsymbol{G}_{a}\right]=} & {\left[H G_{b}\right]=} \\
K_{a}= & {\left[H \boldsymbol{G}_{2}\right]=} \\
\beta= &
\end{array}
$$

If you could not answer this question, for further calculations use reference values $K_{a}=3.14$ and $\beta$ $=2.72$.
2.2. Find the correct order of standard molar Gibbs energies of formation of host $\boldsymbol{H}$ and all hostguest complexes from $\boldsymbol{H}$ and $\boldsymbol{G}$. In the scheme below, write the corresponding chemical formula near every line.

2.3. Some amount of $\boldsymbol{G}$ was added to 1 mole of $\boldsymbol{H}$ and the mixture was dissolved in water to obtain 1 liter of the solution. The number of the totally bound molecules $\boldsymbol{H} \boldsymbol{G}_{\mathbf{2}}$ in the solution is equal to the total number of single-bound molecules $\boldsymbol{H} \boldsymbol{G}$. Find the initial amount of $\boldsymbol{G}$ (in mol). The constants $K_{a}$ and $K_{b}$ and the factor $\beta$ are the same as in question 2.1.

## Calculations:

$$
n_{0}(G)=
$$

Total 3 pts
1.2. Find the equilibrium constant for the process: $\boldsymbol{H} \boldsymbol{G}_{\boldsymbol{b}}+\boldsymbol{G} \rightleftarrows \boldsymbol{H} \boldsymbol{G}_{\mathbf{2}}$ in terms of binding constant(s) and interaction factor.

## Calculations:

$$
\begin{aligned}
& K=\frac{\left[H G_{2}\right]}{\left[H G_{b}\right][G]}=\frac{\left[H G_{2}\right]}{\left[H G_{a}\right][G]} \cdot \frac{\left[H G_{a}\right]}{\left[H G_{b}\right]}=\beta K_{b} \cdot \frac{K_{a}}{K_{b}}=\beta K_{a} \\
& \boldsymbol{K}=\beta K_{a}
\end{aligned}
$$

2.1. The solution was prepared with the initial concentrations $[\boldsymbol{H}]_{0}=1 \mathrm{M}$ and $[\boldsymbol{G}]_{0}=2 \mathrm{M}$. After the reactions were completed, the concentration of $\boldsymbol{H}$ decreased by 10 times and that of $\boldsymbol{G}$ by 4 times. For these host and guest, $K_{b}=2 K_{a}$. Determine the concentrations of all other species in the solution and find the binding constant $K_{a}$ and the factor $\beta$.

## Calculations:

$$
\text { From } K_{b}=2 K_{a} \text { it follows: }\left[\boldsymbol{H} \boldsymbol{G}_{\boldsymbol{b}}\right]=2\left[\boldsymbol{H} \boldsymbol{G}_{\boldsymbol{a}}\right] \quad \mathbf{1} \mathbf{~ p t}
$$

Material balance with respect to $\boldsymbol{H}$ :

$$
\begin{aligned}
& {[\boldsymbol{H}]+\left[\boldsymbol{H G}_{\boldsymbol{a}}\right]+\left[\boldsymbol{H G}_{\boldsymbol{b}}\right]+\left[\boldsymbol{H G}_{\mathbf{2}}\right]=[\boldsymbol{H}]_{0}=1 \mathrm{M}, \text { or }} \\
& 0.1+3\left[\boldsymbol{H G}_{\boldsymbol{a}}\right]+\left[\boldsymbol{H G}_{\mathbf{2}}\right]=1 \mathrm{M} \quad \mathbf{0 . 5} \mathbf{~ p t} \\
& {[\boldsymbol{G}]+\left[\boldsymbol{H} \boldsymbol{G}_{\boldsymbol{a}}\right]+\left[\boldsymbol{H G}_{\boldsymbol{b}}\right]+2\left[\boldsymbol{H} \boldsymbol{G}_{\mathbf{2}}\right]=[\boldsymbol{G}]_{0}=2 \mathrm{M}, \text { or }} \\
& 0.5+3\left[\boldsymbol{H G}_{\boldsymbol{a}}\right]+2\left[\boldsymbol{H G}_{\mathbf{2}}\right]=2 \mathrm{M} . \quad \mathbf{0 . 5} \mathbf{~ p t}
\end{aligned}
$$

Material balance with respect to $\boldsymbol{G}$ :

Solving the system of two equations, we find: $\left[\boldsymbol{H G}_{\boldsymbol{a}}\right]=0.1 \mathrm{M},\left[\boldsymbol{H G}_{\mathbf{2}}\right]=0.6 \mathrm{M}$, hence $\left[\boldsymbol{H G}_{\boldsymbol{b}}\right]=0.2$ M.

$$
\begin{aligned}
& K_{a}=\frac{\left[H G_{a}\right]}{[H][G]}=\frac{0.1}{0.1 \cdot 0.5}=2 \\
& \beta=\frac{\left[H G_{2}\right]}{\left[H G_{a}\right][G] K_{b}}=\frac{0.6}{0.1 \cdot 0.5 \cdot 4}=3 \\
& {\left[\boldsymbol{H G _ { a }}\right]=0.1 \mathrm{M} \quad\left[\boldsymbol{H} \boldsymbol{G}_{\boldsymbol{b}}\right]=0.2 \mathrm{M}}
\end{aligned}
$$

$\left(\mathbf{1} \mathbf{~ p t}\right.$ for $\left[\boldsymbol{H G}_{\boldsymbol{a}}\right], \mathbf{2} \mathbf{~ p t s}$ for $\left[\boldsymbol{H G}_{\mathbf{2}}\right]$, and $\left[\boldsymbol{H G}_{\boldsymbol{b}}\right]$ is not marked if $\left[\boldsymbol{H G}_{\boldsymbol{b}}\right]=2\left[\boldsymbol{H G}_{\boldsymbol{a}}\right]$ was given 1 pt , otherwise $\mathbf{1} \mathbf{~ p t}$ )

$$
\begin{array}{ll}
K_{a}=2 & \mathbf{1 p t} \\
\beta=3 & \mathbf{2 ~ p t s}
\end{array}
$$

$$
\text { Total } \mathbf{8} \text { pts }
$$

If you could not answer this question, for further calculations use reference values $K_{a}=3.14$ and $\beta$ $=2.72$.
2.2. Find the correct order of standard molar Gibbs energies of formation of host $\boldsymbol{H}$ and all hostguest complexes from $\boldsymbol{H}$ and $\boldsymbol{G}$. In the scheme below, write the corresponding chemical formula near every line.

$1 \mathbf{p t}$ - for the highest $\Delta G^{\circ}(\boldsymbol{H})$,
$\mathbf{1} \mathbf{p t}$ - for the lowest $\Delta G^{\circ}\left(\boldsymbol{H G}_{\mathbf{2}}\right)$
$1 \mathbf{p t}-$ for $\Delta G^{\circ}\left(\boldsymbol{H} \boldsymbol{G}_{\boldsymbol{a}}\right)>\Delta G^{\circ}\left(\boldsymbol{H} \boldsymbol{G}_{\boldsymbol{b}}\right)$
2.3. Some amount of $\boldsymbol{G}$ was added to 1 mole of $\boldsymbol{H}$ and the mixture was dissolved in water to obtain 1 liter of the solution. The number of the totally bound molecules $\boldsymbol{H} \boldsymbol{G}_{\mathbf{2}}$ in the solution is equal to the total number of single-bound molecules $\boldsymbol{H} \boldsymbol{G}$. Find the initial amount of $\boldsymbol{G}$ (in mol). The constants $K_{a}$ and $K_{b}$ and the factor $\beta$ are the same as in question 2.1.

## Calculations:

1) $\left[H G_{2}\right]=\left[H G_{a}\right]+\left[H G_{b}\right]=3\left[H G_{a}\right]$

$$
\frac{\left[H G_{2}\right]}{\left[H G_{a}\right][G]}=\beta K_{b}=12, \quad \frac{3}{[G]}=12, \quad[G]=0.25 \mathrm{M}
$$

2) Material balance with respect to $H$ :

$$
\begin{aligned}
& {[H]+3\left[H G_{a}\right]+\left[H G_{2}\right]=1 \mathrm{M}} \\
& {[H]+6\left[H G_{a}\right]=1 \mathrm{M}} \\
& {[H]+12[H][G]=1 \mathrm{M}} \\
& {[H]=0.25 \mathrm{M} .}
\end{aligned}
$$

3) $\left[H G_{a}\right]=K_{a}[H][G]=0.125 \mathrm{M}$. $\left[H G_{2}\right]=3\left[H G_{a}\right]=0.375 \mathrm{M}$.
4) Material balance with respect to $G: \quad[G]_{0}=[G]+3\left[H G_{a}\right]+2\left[H G_{2}\right]=1.375 \mathrm{M}$

$$
n_{0}(G)=1.375 \mathrm{~mol}
$$

Correct determination of $[G],[H],\left[H G_{a}\right],\left[H G_{2}\right]-\mathbf{1} \mathbf{p t}$ for each concentration $n_{0}(G)-2$ pts
2.4. What would be the equilibrium composition of the solution if: a) $\beta=0$; b) $\beta$ is very large ( $\beta \rightarrow$ $\infty)$. The constants $K_{a}$ and $K_{b}$ as well as the initial concentrations of $\boldsymbol{H}$ and $\boldsymbol{G}$ are the same as in question 2.1.

$$
\beta=0
$$

Calculations:
In this case, no $\boldsymbol{H \boldsymbol { G } _ { 2 }}$ is formed.
Material balance with respect to $\boldsymbol{H}:[\boldsymbol{H}]+\left[\boldsymbol{H G}_{a}\right]+\left[\boldsymbol{H} \boldsymbol{G}_{\boldsymbol{b}}\right]=1 \mathrm{M}$, or

$$
[\boldsymbol{H}]+3\left[\boldsymbol{H} \boldsymbol{G}_{a}\right]=1 \mathrm{M}
$$

Material balance with respect to $\boldsymbol{G}:[\boldsymbol{G}]+\left[\boldsymbol{H G}_{\boldsymbol{a}}\right]+\left[\boldsymbol{H} \boldsymbol{G}_{\boldsymbol{b}}\right]=2 \mathrm{M}$, or

Equilibrium constant:

$$
\begin{aligned}
& {[\boldsymbol{G}]+3\left[\boldsymbol{H} \boldsymbol{G}_{a}\right]=2 \mathrm{M}} \\
& K_{a}=\frac{\left[H G_{a}\right]}{[H][G]}=2
\end{aligned}
$$

Solving the system of three equations, we get:

$$
\begin{array}{llll}
{[\boldsymbol{H}]=0.129 \mathrm{M}} & {[\boldsymbol{G}]=1.129 \mathrm{M}} & {\left[\boldsymbol{H} \boldsymbol{G}_{\boldsymbol{a}}\right]=0.290 \mathrm{M}} & {\left[\boldsymbol{H} \boldsymbol{G}_{\boldsymbol{b}}\right]=0.580 \mathrm{M}} \\
{\left[\boldsymbol{H} \boldsymbol{G}_{\mathbf{2}}\right]=0} & &
\end{array}
$$

$$
\mathbf{1} \mathbf{p t} \text { for each concentration except } \boldsymbol{H} \boldsymbol{G}_{\boldsymbol{b}} \text {, maximum - } \mathbf{4} \mathbf{p t s}
$$

$$
\beta \rightarrow \infty
$$

Calculations (or arguments):
In this case, formation of $\boldsymbol{H \boldsymbol { G } _ { 2 }}$ is practically irreversible, so only $\boldsymbol{H \boldsymbol { G } _ { \mathbf { 2 } }}$ is present in the solution.

$$
\begin{array}{llll}
{[\boldsymbol{H}]=0} & {[\boldsymbol{G}]=0} & {\left[\boldsymbol{H} \boldsymbol{G}_{\boldsymbol{a}}\right]=0} & {\left[\boldsymbol{H} \boldsymbol{G}_{\boldsymbol{b}}\right]=0} \\
{\left[\boldsymbol{H} \boldsymbol{G}_{\mathbf{2}}\right]=1 \mathrm{M}} & &
\end{array}
$$

ABC-1
Problem 5. Indispensable glucose
(8 points)

| Question | 1 |  |  |  |  |  |  |  |  |  |  |  |  | Total |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 1.1 | 1.2 | 1.3 | 1.4 | 1.5 | 1.6 | 2.1 | 2.2 | 2.3 | 2.4 | 2.5 |  |  |  |  |  |  |  |
| Marks | 2 | 3 | 6 | 4 | 6 | 1 | 2 | 2 | 4 | 2 | 2 | 34 |  |  |  |  |  |  |

Carbohydrates are the most important providers of energy for living cells. Monosaccharide glucose is a source of energy for the living cell, but for persons who suffer from diabetes glucose may be dangerous. High level of glucose may lead to cardiovascular diseases and even death. That is why people avoid consuming too much carbohydrates and glucose particularly.

## 1. Determination of reducing sugars in fruit juice

One of the technique for determination of reducing sugars in different samples includes the use of Fehling's reagent. A $10.00-\mathrm{mL}$ aliquot of fruit juice (assuming the initial sample contained only glucose and fructose) was transferred into a titration flask and Fehling's reagent was added. This reagent was prepared by mixing 50.00 mL of 0.04000 M copper sulfate (solution A) and potassiumsodium tartrate and sodium hydroxide (solution B). Solution C thus obtained, was then heated and red precipitate was formed.

Glucose
1.1. Write the balanced ionic equation of chemical reaction occurring upon heating of the solution C. Use $\mathrm{Cu}^{2+}$ for initial copper solution.

After that 10 mL of $10 \%$ solution of potassium iodide and 1 M sulfuric acid were added to the flask. The mixture was covered with watch glass and was then placed in a dark place. An excess of iodine was then titrated with 0.05078 M sodium thiosulphate solution. 11.87 mL of the titrant was required to reach the endpoint.
1.2. Write the balanced equation(s) in molecular or ionic form for all the reactions taking place in the flask.
$\square$
1.3. Consider all fructose was transformed into glucose under the experimental conditions; calculate the total mass content of sugars (in $\mathrm{g} / \mathrm{L}$ ) in a fruit juice. $\mathrm{Mw}=180.16 \mathrm{~g} / \mathrm{mol}$.
$\square$

A new $10.00-\mathrm{mL}$ aliquot of the same juice was treated with a $10.00-\mathrm{mL}$ portion of acidified potassium iodate $(\mathrm{V})$ solution $(0.01502 \mathrm{M})$ and 10 mL of $10 \%$ solution of potassium iodide. After the mixture turned brown, an excess of sodium hydroxide solution was added. The flask was then covered with a watch glass and put into a dark place. The obtained solution was acidified and titrated with 0.01089 M solution of sodium thiosulphate. The average titrant volume used for titration was 23.43 mL . Note that fructose is not converted into glucose under these conditions.
1.4. Write all the balanced equations for the described reactions in molecular or ionic form.
$\square$
1.5. Calculate the mass content of each sugar (in $\mathrm{g} / \mathrm{L}$ ) in the juice.
$\square$
1.6. One bread exchange unit ( 1 BEU ) corresponds to the content of 12 g of digestible carbohydrates in product. How many BEU are in one glass ( 200 mL ) of juice?

## Problem 5. Indispensable glucose <br> (8 points)

| Question | 1 |  |  |  |  |  | 2 |  |  |  |  | Total |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

One of the technique for determination of reducing sugars in different samples includes the use of Fehling's reagent. A $10.00-\mathrm{mL}$ aliquot of fruit juice (assuming the initial sample contained only glucose and fructose) was transferred into a titration flask and Fehling's reagent was added. This reagent was prepared by mixing 50.00 mL of 0.04000 M copper sulfate (solution A) and potassiumsodium tartrate and sodium hydroxide (solution B). Solution C thus obtained, was then heated and red precipitate was formed.

Glucose
1.1. Write the balanced ionic equation of chemical reaction occurring upon heating of the solution C . Use $\mathrm{Cu}^{2+}$ for initial copper solution.

| $\mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{6}+2 \mathrm{Cu}^{2+}+5 \mathrm{OH}^{-}=\mathrm{C}_{6} \mathrm{H}_{11} \mathrm{O}_{7}^{-}+\mathrm{Cu}_{2} \mathrm{O}+3 \mathrm{H}_{2} \mathrm{O}$ | points |
| :---: | :--- |
| If $\mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{7}$ instead of $\mathrm{C}_{6} \mathrm{H}_{11} \mathrm{O}_{7}^{-}$ | $\mathbf{1}$ point |
| Hereinafter if an equation is not balanced, then points/2. |  |

After that 10 mL of $10 \%$ solution of potassium iodide and 1 M sulfuric acid were added to the flask. The mixture was covered with watch glass and was then placed in a dark place. An excess of iodine was then titrated with 0.05078 M sodium thiosulphate solution. 11.87 mL of the titrant was required to reach the endpoint.
1.2. Write the balanced equation(s) in molecular or ionic form for all the reactions taking place in the flask.

$$
\begin{gathered}
2 \mathrm{CuSO}_{4}+4 \mathrm{KI}=2 \mathrm{CuI}+\mathrm{I}_{2}+2 \mathrm{~K}_{2} \mathrm{SO}_{4} \\
\text { or } 2 \mathrm{Cu}^{2+}+4 \mathrm{I}^{-}=2 \mathrm{CuI}+\mathrm{I}_{2} \\
\mathrm{KI}+\mathrm{I}_{2}=\mathrm{KI}_{3} \\
\text { or } \quad \mathrm{I}^{-}+\mathrm{I}_{2}=\mathrm{I}_{3}^{-} \\
\mathrm{C}_{6} \mathrm{H}_{11} \mathrm{O}_{7}^{-}+\mathrm{H}_{2} \mathrm{SO}_{4}=\mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{8}+\mathrm{HSO}_{4}^{-} \\
2 \mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3}+\mathrm{I}_{2}=2 \mathrm{NaI}^{-}+\mathrm{Na}_{2} \mathrm{~S}_{4} \mathrm{O}_{6} \\
\text { or } 2 \mathrm{~S}_{2} \mathrm{O}_{3}^{2-}+\mathrm{I}_{2}=2 \mathrm{I}^{-}+\mathrm{S}_{4} \mathrm{O}_{6}^{2-}
\end{gathered}

1.3. Consider all fructose was transformed into glucose under the experimental conditions; calculate the total mass content of sugars (in $\mathrm{g} / \mathrm{L}$ ) in a fruit juice. $\mathrm{Mw}=180.16 \mathrm{~g} / \mathrm{mol}$.
Total amount of copper(II) is $50.00 \mathrm{~mL} * 0.04000 \mathrm{M}=2.0000 \mathrm{mmol}$.
Obviously, there is an excess of iodine and the remaining iodine was titrated with sodium thiosulphate: $11.87 \mathrm{~mL} * 0.05078 \mathrm{M}=0.6028 \mathrm{mmol}$.
$2.0000-0.6028 \mathrm{mmol}=1.3972 \mathrm{mmol}$ of copper(II) was required to oxidize the sugars.
6 points $v($ sugars $)=v\left(\mathrm{Cu}^{2+}\right) / 2=0.6986 \mathrm{mmol}$ in 10.00 mL
C (sugars) $=0.6986 \mathrm{mmol} / 10.00 \mathrm{~mL}=0.06986 \mathrm{M}$
mass content $=180.16 \mathrm{~g} / \mathrm{mol} * 0.06986 \mathrm{M}=12.6 \mathrm{~g} / \mathrm{L}$

A new $10.00-\mathrm{mL}$ aliquot of the same juice was treated with a $10.00-\mathrm{mL}$ portion of acidified potassium iodate $(\mathrm{V})$ solution $(0.01502 \mathrm{M})$ and 10 mL of $10 \%$ solution of potassium iodide. After the mixture turned brown, an excess of sodium hydroxide solution was added. The flask was then covered with a watch glass and put into a dark place. The obtained solution was acidified and titrated with 0.01089 M solution of sodium thiosulphate. The average titrant volume used for titration was 23.43 mL . Note that fructose is not converted into glucose under these conditions.
1.4. Write all the balanced equations for the described reactions in molecular or ionic form.

| $\mathrm{KIO}_{3}+5 \mathrm{KI}+3 \mathrm{H}_{2} \mathrm{SO}_{4}=3 \mathrm{I}_{2}+3 \mathrm{~K}_{2} \mathrm{SO}_{4}+3 \mathrm{H}_{2} \mathrm{O}$ |  |

## 2. Diagnosis of diseases

The derivative of glucose, 2-deoxy-2-( $\left.{ }^{18} \mathrm{~F}\right)$ fluoro-D-glucose (FDG), is the most common radiopharmaceuticals for diagnosis of cancer using positron emission tomography. The first step of FDG preparation is to produce a radionuclide fluoro-18 by nuclear reaction in a cyclotron. The next step is the radiochemical synthesis. Fluorine-18 is introduced into D-glucose molecule by

## Problem 3

## $9 \%$ of the total

Iodine deficiency is of special concern in Georgia because it occupies a region where iodine is scarce in soil and water. Iodine deficiency can be effectively and inexpensively prevented if salt for human consumption is fortified with small amounts of iodine. Methods for analyzing salt for iodine content are thus important. Current regulations in Georgia are that iodized salt must contain between $25-55 \mathrm{ppm}$ iodine $(1 \mathrm{ppm}=$ 1 mg iodine $/ \mathrm{kg}$ salt).

Most salt is iodized by fortification with potassium iodate ( $\mathrm{KIO}_{3}$ ). Iodate content can be determined in salt samples using iodometric titration. In a typical procedure, 10.000 g of an iodized salt sample is dissolved in $100 \mathrm{~cm}^{3}$ of $1.0 \mathrm{~mol} / \mathrm{dm}^{3}$ aqueous HCl to which 1.0 g KI has been added. The solution is then titrated with $0.00235 \mathrm{~mol} / \mathrm{dm}^{3}$ aqueous sodium thiosulfate solution to a starch endpoint; this requires $7.50 \mathrm{~cm}^{3}$ of titrant.
3.1.1. Write a balanced net ionic equation for the reaction when iodate reacts with excess iodide in acidic solution.
3.1.2. Write a balanced net ionic equation for the reaction taking place during the titration with thiosulfate.
3.1.3. Calculate the iodization level, in ppm, of this salt sample.

## A less common agent for iodizing salt is potassium iodide, which cannot be easily measured by iodometric titration.

One possible method for analyzing iodide in the presence of chloride is potentiometric titration. However, this method is not very precise in the presence of large amounts of chloride.

In this method, a silver wire is immersed in the solution (containing iodide and chloride) to be analyzed and silver ion is gradually added to the solution. The potential of the silver wire is measured relative to a reference electrode consisting of a silver wire in a $1.000 \mathrm{~mol} / \mathrm{dm}^{3}$ solution of $\mathrm{AgNO}_{3}$. The measured potentials are negative and the absolute values of these potentials are reported. The solution to be analyzed has a volume of $1.000 \mathrm{dm}^{3}$ (which you may assume does not change as silver ion is added), and $T=25.0^{\circ} \mathrm{C}$.

The results of this experiment are governed by three equilibria: the solubility of $\operatorname{AgI}(s)$ [ $\left.K_{\text {spl }}\right]$ and $\mathrm{AgCl}(\mathrm{s})\left[K_{\mathrm{spcl}}\right]$ and the formation of $\mathrm{AgCl}_{2}{ }^{-}(\mathrm{aq})$ [ $\mathrm{Kf}_{\mathrm{f}}$. (Iodide also forms complex ions with silver but this may be neglected at the very low concentrations of iodide present in this experiment).

$$
\begin{array}{ll}
\mathrm{AgI}(\mathrm{~s}) \rightleftharpoons \mathrm{Ag}^{+}(\mathrm{aq})+\mathrm{I}^{-}(\mathrm{aq}) & K_{\mathrm{spl}} \\
\operatorname{AgCl}(\mathrm{~s}) \rightleftharpoons \mathrm{Ag}^{+}(\mathrm{aq})+\mathrm{Cl}^{-}(\mathrm{aq}) & K_{\mathrm{spcl}} \\
\mathrm{Ag}^{+}(\mathrm{aq})+2 \mathrm{Cl}^{-}(\mathrm{aq}) \rightleftharpoons \mathrm{AgCl}_{2}^{-}(\mathrm{aq}) & K_{\mathrm{f}}
\end{array}
$$

Below are shown the results of two experiments measuring the observed potential as a function of added number of moles of silver ion. Experiment $\mathbf{A}$ (solid circles) was carried out with $1.000 \mathrm{dm}^{3}$ of solution containing $1.00 \cdot 10^{-5} \mathrm{~mol} / \mathrm{dm}^{3}$ iodide and no chloride ion. Experiment B (open circles) was done using $1.000 \mathrm{dm}^{3}$ of solution containing $1.00 \cdot 10^{-5} \mathrm{~mol} / \mathrm{dm}^{3}$ iodide and $1.00 \cdot 10^{-1} \mathrm{~mol} / \mathrm{dm}^{3}$ chloride.

3.2.1. Select an appropriate data point from the experiments and use it to calculate the solubility product of $\mathrm{AgI}\left(K_{\text {spI }}\right)$.
3.2.2. Select an appropriate data point from the experiments and use it to calculate the solubility product of $\mathrm{AgCl}\left(K_{\mathrm{spcl}}\right)$.
3.2.3. Select an appropriate data point from the experiments and use it to calculate $K$ f. You may need to use values of $K_{\text {spl }}$ or $K_{\text {spcl }}$ to do this calculation. If you were unable to carry out the calculations in 3.2.1. or 3.2.2., you may use the arbitrary values of $K_{\mathrm{spl}}=1.00 \cdot 10^{-15}$ and $K_{\mathrm{spcl}}=1.00 \cdot 10^{-9}$ without penalty.

An analytical method that is more practical, because it is not sensitive to the presence of chloride, uses the Sandell-Kolthoff reaction. This is the reaction of $\mathrm{H}_{3} \mathrm{AsO}_{3}$ with Ce (IV) to give Ce(III) in acidic solution, which is strongly catalyzed by iodide ion.
3.3.1. Write balanced net ionic equations for the reaction of cerium(IV) with $\mathrm{H}_{3} \mathrm{AsO}_{3}$ in acidic solution, as well as reactions of cerium(IV) with a species containing the element iodine and $\mathrm{H}_{3} \mathrm{AsO}_{3}$ with a species containing the element iodine, that could reasonably account for the catalysis of the net reaction by iodide.

The reaction of $\mathrm{Ce}(\mathrm{IV})$ with $\mathrm{H}_{3} \mathrm{AsO}_{3}$ can be monitored by measuring the absorbance at 405 nm , as Ce(IV) is orange and absorbs significantly at 405 nm , while the other reactants and products are colorless and do not absorb appreciably. Three runs were carried out, all in $0.50 \mathrm{~mol} / \mathrm{dm}^{3} \mathrm{H}_{2} \mathrm{SO}_{4}$ at $25.0^{\circ} \mathrm{C}$ using the following initial concentrations:

| Run | $\left[\mathrm{H}_{3} \mathrm{AsO}_{3}\right]_{0}$, <br> $\mathrm{mol} \mathrm{dm}^{-3}$ | $[\mathrm{Ce}(\mathrm{IV})]_{0}$, <br> $\mathrm{mol} \mathrm{dm}^{-3}$ | $\left[\mathrm{I}^{-}\right]_{0,}$, <br> $\mathrm{mol} \mathrm{dm}^{-3}$ |
| :---: | :---: | :---: | :---: |
| 1 | 0.01250 | 0.00120 | $1.43 \cdot 10^{-6}$ |
| 2 | 0.00625 | 0.00060 | $1.43 \cdot 10^{-6}$ |
| 3 | 0.01250 | 0.00120 | $7.16 \cdot 10^{-7}$ |

An analyst initiated the reactions by mixing the reagents in a cuvette. After a short variable delay absorbance measurements were started, with the first measurement recorded at $t=0 \mathrm{~s}$. The data obtained are shown below:

| $t, \mathrm{~s}$ | $A_{405}$ <br> Run 1 | $A_{405}$ <br> Run 2 | $A_{405}$ <br> Run 3 |
| :---: | :---: | :---: | :---: |
| 0 | 0.621 | 0.287 | 0.818 |
| 20 | 0.348 | 0.149 | 0.608 |
| 40 | 0.198 | 0.083 | 0.455 |
| 60 | 0.113 | 0.046 | 0.340 |
| 80 | 0.064 | 0.025 | 0.254 |
| 100 | 0.037 | 0.014 | 0.191 |

Under these conditions ( $0.5 \mathrm{~mol} / \mathrm{dm}^{3} \mathrm{H}_{2} \mathrm{SO}_{4}, 25.0^{\circ} \mathrm{C}$ ), the rate law for the reaction can be written as

Rate $=k\left[\mathrm{H}_{3} \mathrm{AsO}_{3}\right]^{m}[\mathrm{Ce}(\mathrm{IV})]^{n}\left[\mathrm{I}^{-}\right]^{p} \quad$ where $m, n$, and $p$ are integers.
3.3.2. Determine the values of $m, n$, and $p$ and calculate the value of $k$ (be sure to specify its units).

A 1.000 g sample of iodized salt is dissolved in water to give $10.00 \mathrm{~cm}^{3}$ of solution. A $0.0500 \mathrm{~cm}^{3}$ aliquot of this solution is added to a mixture of $1.000 \mathrm{~cm}^{3} 0.025 \mathrm{~mol} / \mathrm{dm}^{3}$ $\mathrm{H}_{3} \mathrm{AsO}_{3}$ in $0.5 \mathrm{~mol} / \mathrm{dm}^{3} \mathrm{H}_{2} \mathrm{SO}_{4}$ and $0.800 \mathrm{~cm}^{3} 0.5 \mathrm{~mol} / \mathrm{dm}^{3} \mathrm{H}_{2} \mathrm{SO}_{4}$. To this mixture is added $0.200 \mathrm{~cm}^{3} 0.0120 \mathrm{~mol} / \mathrm{dm}^{3} \mathrm{Ce}\left(\mathrm{NH}_{4}\right)_{2}\left(\mathrm{NO}_{3}\right)_{6}$ in $0.5 \mathrm{~mol} / \mathrm{dm}^{3} \mathrm{H}_{2} \mathrm{SO}_{4}$ and the absorbance at 405 nm is measured as a function of time at $25.0^{\circ} \mathrm{C}$ :

| $t, \mathrm{~s}$ | $A_{405}$ |
| :---: | :---: |
| 0 | 0.756 |
| 20 | 0.531 |
| 40 | 0.373 |
| 60 | 0.262 |
| 80 | 0.185 |
| 100 | 0.129 |

3.3.3. Calculate the iodization level, in ppm, of this salt sample.

2 p (1p species, 1 p coefficients, 0.5 p penalty if spectator ions are included.)
3.1.3. Calculate the iodization level, in ppm , of this salt sample.

Your work:
$\left(0.00750 \mathrm{dm}^{3}\right.$ titrant $) \cdot\left(0.00235 \mathrm{~mol} \mathrm{dm}^{-3} \mathrm{~S}_{2} \mathrm{O}_{3}{ }^{2-}\right)=1.76 \cdot 10^{-5} \mathrm{~mol} \mathrm{~S}_{2} \mathrm{O}_{3}{ }^{2-}$
$\left(1.76 \cdot 10^{-5} \mathrm{~mol} \mathrm{~S}_{2} \mathrm{O}_{3}{ }^{2-}\right) \cdot\left(1 \mathrm{~mol} \mathrm{IO}_{3}{ }^{-} / 6 \mathrm{~mol} \mathrm{~S}_{2} \mathrm{O}_{3}{ }^{2-}\right)=2.94 \cdot 10^{-6} \mathrm{~mol} \mathrm{IO}_{3}{ }^{-}$
$\left(2.94 \cdot 10^{-6} \mathrm{~mol} \mathrm{IO}_{3}{ }^{-}\right) \cdot(126.90 \mathrm{~g} / \mathrm{mol})=3.73 \cdot 10^{-4} \mathrm{~g}$ iodine
$\left\{\left(3.73 \cdot 10^{-4} \mathrm{~g}\right.\right.$ iodine $) /(10.00 \mathrm{~g}$ salt $\left.)\right\} \cdot 10^{6} \mathrm{ppm}=37.3 \mathrm{ppm}$ iodine
2 p for calculating mol thiosulfate
2 p for calculating mol iodate
2 p for converting to ppm
3.2.1. Select an appropriate data point from the experiments and use it to calculate the solubility product of $\mathrm{AgI}\left(K_{\text {spl }}\right)$.

## Your work:

In the experiments, $|E|=-(R T / n F) \ln \left(\left[\mathrm{Ag}^{+}\right]_{\text {cell }} /\left[\mathrm{Ag}^{+}\right]_{\mathrm{ref}}\right)=-0.0591 \cdot \log \left[\mathrm{Ag}^{+}\right]$
There is a sharp endpoint at $n\left(\right.$ added $\left.\mathrm{Ag}^{+}\right)=n\left(\mathrm{I}^{-}\right.$initially present $)$in experiment A ([Cl- $=0$ ), so precipitation of $\operatorname{AgI}(\mathrm{s})$ must be essentially complete at any point in the titration curve. If one considers, for example, $5.0 \mu \mathrm{~mol}$ added $\mathrm{Ag}^{+}$, then
$\left[\mathrm{I}^{-}\right]=\left[\mathrm{I}^{-}\right]_{0}-5.0 \cdot 10^{-6} \mathrm{~mol} / \mathrm{dm}^{3}=5.0 \cdot 10^{-6} \mathrm{~mol} / \mathrm{dm}^{3}$
$|E|=0.622 \mathrm{~V}=-0.0591 \cdot \log \left[\mathrm{Ag}^{+}\right] \Rightarrow\left[\mathrm{Ag}^{+}\right]=3.2 \cdot 10^{-11} \mathrm{~mol} / \mathrm{dm}^{3}$
$K_{\text {spl }}=\left[\mathrm{Ag}^{+}\right]\left[\mathrm{I}^{-}\right]=1.6 \cdot 10^{-16}$
2 p for relationship between $E$ and $\left[\mathrm{Ag}^{+}\right]$(full credit if used even if not stated explicitly)

1 p for selecting a data point with $n\left(\mathrm{Ag}^{+}\right) \leq 10.0 \mu \mathrm{~mol}$
2p for calculation of $K_{\text {spI }}$
Full marks are awarded here and later for correct answers with numerical
$K_{\text {spl }}$ :
3.2.2. Select an appropriate data point from the experiments and use it to calculate the solubility product of $\mathrm{AgCl}\left(K_{\mathrm{spcl}}\right)$.

## Your work:

In the titration with $\left[\mathrm{Cl}^{-}\right]=0.100 \mathrm{~mol} / \mathrm{dm}^{3}$ (experiment B), the fact that the potential stops changing at $n\left(\right.$ added $\left.\mathrm{Ag}^{+}\right) \geq 11.8 \mu \mathrm{~mol}$ must be due to the precipitation of $\mathrm{AgCl}(\mathrm{s})$ (the high concentration of chloride therefore effectively fixes the $\left[\mathrm{Ag}^{+}\right]$in the solution). So in this regime:
$|E|=0.517 \mathrm{~V}=-0.0591 \cdot \log \left[\mathrm{Ag}^{+}\right] \Rightarrow\left[\mathrm{Ag}^{+}\right]=1.6 \cdot 10^{-9} \mathrm{~mol} / \mathrm{dm}^{3}$
$K_{\text {spCl }}=\left[\mathrm{Ag}^{+}\right]\left[\mathrm{Cl}^{-}\right]=1.6 \cdot 10^{-10}$
1 p for selecting a data point with $n\left(\mathrm{Ag}^{+}\right)>11.8 \mu \mathrm{~mol}$
3p for calculation of Kspcl
$K_{\mathrm{spCl}}$ :
3.2.3. Select an appropriate data point from the experiments and use it to calculate $K$ f. You may need to use values of $K_{\text {spl }}$ or $K_{\text {spcl }}$ to do this calculation. If you were unable to carry out the calculations in 3.2.1. or 3.2.2., you may use the arbitrary values of $K_{\mathrm{spl}}=1.00 \cdot 10^{-15}$ and $K_{\mathrm{spcl}}=1.00 \cdot 10^{-9}$ without penalty.

## Your work:

There are a number of good approaches to this problem.
One can use the point at which $\mathrm{AgCl}(\mathrm{s})$ first precipitates (estimated at $11.8 \mu \mathrm{~mol} \mathrm{Ag}^{+}$added) to calculate $K$ f. At this point, $\left[\mathrm{Ag}^{+}\right]=1.6 \cdot 10^{-9} \mathrm{~mol} / \mathrm{dm}^{3}$, [ $\mathrm{Cl}-]=0.100 \mathrm{~mol} / \mathrm{dm}^{3}$ (see above).
Almost all of the originally present $1.0 \cdot 10^{-5} \mathrm{~mol} / \mathrm{dm}^{3}$ iodide has been precipitated out as $9.9 \mu \mathrm{~mol} \mathrm{AgI}$, since $\left[\mathrm{I}^{-}\right]=K_{\text {spl }} /\left[\mathrm{Ag}^{+}\right]=1.0^{-10^{-7}} \mathrm{~mol} / \mathrm{dm}^{3}$

Total Ag in solution $=11.8 \mu \mathrm{~mol}-9.9 \mu \mathrm{~mol}=1.9 \mu \mathrm{~mol}$
$\left[\mathrm{AgCl}_{2}{ }^{-}\right]=1.9 \cdot 10^{-6} \mathrm{~mol} / \mathrm{dm}^{3}$ (since free $\left[\mathrm{Ag}^{+}\right]$is only $1.6 \cdot 10^{-9} \mathrm{~mol} / \mathrm{dm}^{3}$ )
$\mathrm{K}_{\mathrm{f}}=\frac{\left[\mathrm{AgCl}_{2}^{-}\right]}{\left[\mathrm{Ag}^{+}\right]\left[\mathrm{Cl}^{-}\right]^{2}}=\frac{1.9 \cdot 10^{-6}}{1.6 \cdot 10^{-9} \cdot 0.100^{2}}=1.2 \cdot 10^{5} \quad\left[1.9 \cdot 10^{4}\right.$ given const. $]$
Same approach works for $11 \mu \mathrm{~mol} \mathrm{Ag}^{+}$added.
2 p for selecting a data point between 10-12.0 $\mu \mathrm{mol}$
3p for reasonable method of calculating $K_{f}$
2 p for value of $K_{f}$

An alternative approach is to look at the equivalence point, where
$|E|=0.558 \mathrm{~V}=-0.0591 \cdot \log \left[\mathrm{Ag}^{+}\right] \Rightarrow\left[\mathrm{Ag}^{+}\right]=3.62 \cdot 10^{-10} \mathrm{~mol} / \mathrm{dm}^{3}$
Since $\operatorname{AgI}(s)$ is present, $\left[\mathrm{I}^{-}\right]=K_{\text {spl }} /\left[\mathrm{Ag}^{+}\right]=4.42 \cdot 10^{-7} \mathrm{~mol} / \mathrm{dm}^{3}$
The amount of dissolved iodine and silver is equivalent:
$\left[\mathrm{I}^{-}\right]=\left[\mathrm{Ag}^{+}\right]+\left[\mathrm{AgCl}_{2}-\right] \Rightarrow\left[\mathrm{AgCl}_{2}{ }^{-}\right]=4.42 \cdot 10^{-7} \mathrm{~mol} / \mathrm{dm}^{3}$
$\mathrm{K}_{\mathrm{f}}=\frac{\left[\mathrm{AgCl}_{2}^{-}\right]}{\left[\mathrm{Ag}^{+}\right]\left[\mathrm{Cl}^{-}\right]^{2}}=\frac{4.42 \cdot 10^{-7}}{3.62 \cdot 10^{-10} \cdot 0.100^{2}}=1.2 \cdot 10^{5}\left[7.6 \cdot 10^{5}\right.$ given const. $]$
Kf:
3.3.1. Write balanced net ionic equations for the reaction of cerium(IV) with $\mathrm{H}_{3} \mathrm{AsO}_{3}$ in acidic solution, as well as reactions of cerium(IV) with a species containing the element iodine and $\mathrm{H}_{3} \mathrm{AsO}_{3}$ with a species containing the element iodine, that could reasonably account for the catalysis of the net reaction by iodide.

Net reaction of cerium(IV) with $\mathrm{H}_{3} \mathrm{AsO}_{3}$ in acidic solution:
$2 \mathrm{Ce}^{4+}+\mathrm{H}_{3} \mathrm{AsO}_{3}+\mathrm{H}_{2} \mathrm{O} \rightarrow 2 \mathrm{Ce}^{3+}+\mathrm{H}_{3} \mathrm{AsO}_{4}+2 \mathrm{H}^{+}$
2p (1p for $\mathrm{H}_{3} \mathrm{AsO}_{3} / \mathrm{H}_{3} \mathrm{AsO}_{4}$ couple, 1p balanced)

Reaction of cerium(IV) with an iodine-containing species:

$$
2 \mathrm{Ce}^{4+}+2 \mathrm{I}^{-} \rightarrow 2 \mathrm{Ce}^{3+}+\mathrm{I}_{2}
$$

2 p (1p species, 1 p balanced). Full marks for $\mathrm{I}^{-}$or I - as products

Reaction of $\mathrm{H}_{3} \mathrm{AsO}_{3}$ with an iodine-containing species:
$\mathrm{H}_{3} \mathrm{AsO}_{3}+\mathrm{I}_{2}+\mathrm{H}_{2} \mathrm{O} \rightarrow \mathrm{H}_{3} \mathrm{AsO}_{4}+2 \mathrm{I}^{-}+2 \mathrm{H}^{+}$
$2 p$ ( 1 p species, 1 p balanced). Full marks for $\mathrm{I}^{-}$or $\mathrm{I} \cdot$ as products
Two iodine-containing reactions must add up to the net reaction, otherwise $-2 p$ for the iodine-containing reactions
3.3.2. Determine the integer values of $m, n$, and $p$ and calculate the value of $k$ (be sure to specify its units).

## Your work:

The limiting reactant is $\mathrm{Ce}(\mathrm{IV})$ which is $<10 \%$ of the concentration of $\mathrm{H}_{3} \mathrm{AsO}_{3}$, so only the concentration of $\mathrm{Ce}(\mathrm{IV})$ changes appreciably over the course of the reaction. (I- is a catalyst and is not consumed.) So the order in Ce(IV) can be judged by the time course of the reaction. By eye, it appears to be first order.

This can be verified by calculating $-\ln \left(A / A_{0}\right) \cdot(1 / t)$, which should be a constant ( $k_{\text {obs }}$ ) if the reaction is first-order:

| $t, \mathrm{~s}$ | $k_{\text {obs, }} \mathrm{s}^{-1}$, Run 1 | $k_{\text {obs, }} \mathrm{s}^{-1}$, Run 2 | $k_{\mathrm{obs},} \mathrm{s}^{-1}$, Run 3 |
| :---: | :---: | :---: | :---: |
| 20 | 0.0290 | 0.0328 | 0.0148 |
| 40 | 0.0286 | 0.0310 | 0.0147 |
| 60 | 0.0284 | 0.0305 | 0.0146 |
| 80 | 0.0284 | 0.0305 | 0.0146 |
| 100 | 0.0282 | 0.0302 | 0.0145 |
| avg. | 0.0285 | 0.0310 | 0.0146 |

So $n=1$.
Since $k_{\mathrm{obs}}$ is unchanged (within 10\%) from run 1 to run 2 despite decreasing $\left[\mathrm{H}_{3} \mathrm{AsO}_{3}\right]$ by a factor of two, $m=0$.
In contrast, decreasing $\left[\mathrm{I}^{-}\right]$by a factor of two from run 1 to run $\mathbf{3}$ results in a decrease in observed rate constant of a factor of two, so $p=1$.
$k=k_{\text {obs }} /\left[I^{-}\right]$, giving values of $1.99 \cdot 10^{4}, 2.17 \cdot 10^{4}$, and $2.04 \cdot 10^{4} \mathrm{dm}^{3} \mathrm{~mol}^{-1} \mathrm{~s}^{-1}$ for runs 1-3; average $k=2.07 \cdot 10^{4} \mathrm{dm}^{3} \mathrm{~mol}^{-1} \mathrm{~s}^{-1}$.

4 p for documenting 1 st-order in Ce(IV), 2 p each for $m$ and $p$,
2 p for value of $k, 1 \mathrm{p}$ for unit of $k$ consistent with given rate law
$m=\quad n=\quad p=\quad k=$
3.3.3. Calculate the iodization level, in ppm, of the salt sample.

| Your wor |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  |  |  | $t$, s | $-\ln \left(A / A_{0}\right) \cdot(1 / t), \mathrm{s}^{-1}$ |
|  |  |  | 20 | 0.0177 |
|  |  |  | 40 | 0.0177 |
|  |  |  | 60 | 0.0177 |
|  |  |  | 80 | 0.0176 |
|  |  |  | 100 | 0.0177 |
|  |  | So $k_{\text {obs }}=0.0177 \mathrm{~s}^{-1}=k\left[\mathrm{I}^{-}\right]=\left(2.07 \cdot 10^{4} \mathrm{dm}^{3} \mathrm{~mol}^{-1} \mathrm{~s}^{-1}\right)\left[\mathrm{I}^{-}\right]$ |  |  |
|  |  | $\left[I^{-}\right]=8.55 \cdot 10^{-7} \mathrm{~mol} / \mathrm{dm}^{3}$ |  |  |
|  |  | Since the salt solution was diluted by a factor of $\left(2.05 \mathrm{~cm}^{3}\right) /\left(0.050 \mathrm{~cm}^{3}\right)=$ 41, the concentration in the original salt solution was $41 \cdot\left(8.55 \cdot 10^{-7} \mathrm{~mol} / \mathrm{dm}^{3}\right)=3.51 \cdot 10^{-5} \mathrm{~mol} / \mathrm{dm}^{3}$. |  |  |
|  |  | $\left(3.51 \cdot 10^{-5} \mathrm{~mol} \mathrm{dm}^{-3}\right)\left(0.01000 \mathrm{dm}^{3}\right)=3.51 \cdot 10^{-7} \mathrm{~mol} \mathrm{I}$ in the salt sample $\left(3.51 \cdot 10^{-7} \mathrm{~mol}\right.$ iodine $)(126.90 \mathrm{~g} / \mathrm{moI})=4.45 \cdot 10^{-5} \mathrm{~g}$ iodine |  |  |
|  |  | 2 p for calculating $k_{\mathrm{obs}}, 1 \mathrm{p}$ for $\left.\mathrm{II}^{-}\right]$from $k_{\text {obs }}, 2 \mathrm{p}$ for converting to ppm |  |  |

## Problem 4: Electrochemistry

## Part A. Galvanic cell

The experiment is performed at $30.00^{\circ} \mathrm{C}$. The electrochemical cell is composed of a hydrogen half-cell $\left[\mathrm{Pt}(s)\left|\mathrm{H}_{2}(g)\right| \mathrm{H}^{+}(a q)\right]$ containing a metal platinum electrode immersed in a buffer solution under a pressure of hydrogen gas. This hydrogen half-cell is connected to a half-cell of a metal (M) strip dipped in an unknown concentration of $\mathbf{M}^{2+}(a q)$ solution. The two halfcells are connected via a salt bridge as shown in Figure 1.

Note: The standard reduction potentials are given in Table 1.

Figure 1 The galvanic cell

4-A1) If the reaction quotient $(Q)$ of the whole galvanic cell is equal to $2.18 \times 10^{-4}$ at $30.00^{\circ} \mathrm{C}$, the electromotive force is +0.450 V . Calculate the value of standard reduction potential $\left(\mathrm{E}^{\circ}\right)$ and identify the metal " $\mathbf{M}$ ".
Note; $\Delta G=\Delta G^{o}+R T \ln Q$

## Calculations

The standard reduction potential of $\mathbf{M}$ is $\qquad$ V
(Answer with 3 digits after decimal point)
Therefore, the metal " $\mathbf{M}$ " strip is $\qquad$

4-A2) Write the balanced equation of the spontaneous redox reaction of the galvanic cell.
$\square$

4-A3) The unknown concentration of $\mathbf{M}^{2+}(a q)$ solution in the cell (Figure 1) can be analyzed by iodometric titration. A $25.00 \mathrm{~cm}^{3}$ aliquot of $\mathbf{M}^{2+}(a q)$ solution is added into a conical flask and an excess of KI added. $25.05 \mathrm{~cm}^{3}$ of a $0.800 \mathrm{~mol} \mathrm{dm}^{-3}$ sodium thiosulfate is required to reach the equivalent point. Write all the redox reactions associated with this titration and calculate the concentration of $\mathbf{M}^{2+}(a q)$ solution.

## Calculations

The concentration of $\mathbf{M}^{2+}(a q)$ solution is $\qquad$ $\mathrm{mol} \mathrm{dm}^{-3}$
(answer with 3 digits after decimal point)

If student cannot find the answer, the student can use $0.950 \mathrm{~mol} \mathrm{dm}^{-3}$ as the concentration of $\mathbf{M}^{2+}$ for further calculations.

4-A4) In Figure 1, if the hydrogen half-cell is under 0.360 bar hydrogen gas and the platinum electrode is immersed in a $500 \mathrm{~cm}^{3}$ buffer solution containing 0.050 mol lactic acid $\left(\mathrm{HC}_{3} \mathrm{H}_{5} \mathrm{O}_{3}\right)$ and 0.025 mol sodium lactate $\left(\mathrm{C}_{3} \mathrm{H}_{5} \mathrm{O}_{3} \mathrm{Na}\right)$, the electromotive force of the galvanic cell measured is +0.534 V . Calculate the pH of the buffer solution and the dissociation constant $\left(K_{\mathrm{a}}\right)$ of lactic acid at $30.00^{\circ} \mathrm{C}$.

## Calculations of pH of the buffer solution

pH of the buffer solution is $\qquad$
(answer with 2 digits after decimal point)

If student cannot find the answer, the student can use 3.46 as the buffer pH for further calculations.

Calculations of the dissociation constant ( $K_{\mathrm{a}}$ ) of lactic acid

The dissociation constant of lactic acid is $\qquad$

| $\mathrm{S}_{2} \mathrm{O}_{8}{ }^{2-}(a q)+2 \mathrm{e}^{-}$ | $\longrightarrow$ | $2 \mathrm{SO}_{4}{ }^{2-}(a q)$ | +2.010 |

4-A1) If the reaction quotient $(Q)$ of the whole galvanic cell is equal to $2.18 \times 10^{-4}$ at $30.00^{\circ} \mathrm{C}$, the electromotive force is +0.450 V . Calculate the value of standard reduction potential $\left(\mathrm{E}^{\circ}\right)$ and identify the metal " $\mathbf{M}$ ".
Note; $\Delta G=\Delta G^{o}+R T \ln Q$

## Calculations

$$
\begin{aligned}
E_{\text {cell }} & =E^{\circ}{ }_{\text {cell }}-(R T / n F) \ln Q \\
+0.450 & =E^{\circ}{ }_{\text {cell }}-\frac{\left(8.314 \mathrm{~J} \mathrm{~K}^{-1} \mathrm{~mol}^{-1}\right) \times(303.15 \mathrm{~K})}{2 \times 96485 \mathrm{Cmol}^{-1}} \ln 2.18 \times 10^{-4}(1 \text { points }) \\
+0.450 & =E_{\text {cell }}^{\circ}+0.110
\end{aligned}
$$

then $E^{\circ}{ }_{\text {cell }} \quad=+0.450 \mathrm{~V}-0.110 \mathrm{~V}=+0.340 \mathrm{~V}$ (0.5 point)

Therefore,$\quad E^{\circ}$ cell $=E^{\circ}{ }_{\text {cathode }}-E_{\text {anode }}$

$$
+0.340 \mathrm{~V}=E^{\circ}{ }_{\text {cathode }}-0.000 \mathrm{~V} ; E^{\circ}{ }_{\text {cathode }}=+0.340 \mathrm{~V} \quad(0.5 \text { point })
$$

The standard reduction potential of $\mathbf{M}$ is $\qquad$ $+0.340$ $\qquad$ V (0.5 point) (answer with 3 digits after decimal point)

Therefore, the metal " $\mathbf{M}$ " strip is $\qquad$ . $\mathrm{Cu}(\mathrm{s})$ $\qquad$ (1 point)
or
Calculations

$$
\begin{aligned}
E_{\text {cell }} & =E^{\circ}{ }_{\text {cell }}-(2.303 R T / n F) \log Q \\
+0.450 & =E^{\circ}{ }_{\text {cell }}-\frac{2.303\left(8.314 \mathrm{~J} \mathrm{~K}^{-1} \mathrm{~mol}^{-1}\right) \times(303.15 \mathrm{~K}) \log }{2 \times 96485 \mathrm{C} \mathrm{~mol}^{-1}} 2.18 \times 10^{-4} \\
+0.450 & =E^{\circ}{ }_{\text {cell }}+0.110, \\
\text { then } E^{\circ}{ }_{\text {cell }} & =+0.450 \mathrm{~V}-0.110 \mathrm{~V}=+0.340 \mathrm{~V} \\
\text { Therefore; } & E^{\circ}{ }_{\text {cell }}=E^{\circ}{ }_{\text {cathode }}-E_{\text {anode }}^{\circ} \\
& +0.340 \mathrm{~V}=E^{\circ}{ }_{\text {cathode }}-0.000 \mathrm{~V} ; E_{\text {cathode }}^{\circ}=+0.340 \mathrm{~V}
\end{aligned}
$$

The standard reduction potential of $\boldsymbol{M}$ is $\qquad$ $+0.340$ $\qquad$ V
(Answer with 3 digits after decimal point)

Therefore, the metal " $M$ " strip is $\qquad$ $C u(s)$

4-A2) Write the balanced equation of the spontaneous redox reaction of the galvanic cell.
$\mathrm{H}_{2}(\mathrm{~g})+\mathrm{Cu}^{2+}(\mathrm{aq}) \longrightarrow 2 \mathrm{H}^{+}(\mathrm{aq})+\mathrm{Cu}(\mathrm{s})$
(1 point)
1 point for correct balanced equation.If students choose a wrong metal (M)
from 4-A1 but they write the correct balanced equation, they still get 1 point.

4-A3) The unknown concentration of $\mathbf{M}^{2+}(a q)$ solution in the cell (Figure 1) can be analyzed by iodometric titration. A $25.00 \mathrm{~cm}^{3}$ aliquot of $\mathbf{M}^{2+}(a q)$ solution is added into a conical flask and an excess of KI added. $25.05 \mathrm{~cm}^{3}$ of a $0.800 \mathrm{~mol} \mathrm{dm}^{-3}$ sodium thiosulfate is required to reach the equivalent point. Write all the redox reactions associated with this titration and calculate the concentration of $\mathbf{M}^{2+}(a q)$ solution.

## Calculations

Iodometric titration of copper is based on the oxidation of iodide to iodine by copper (II) ions

Reactions taking place,

$$
2 \mathrm{Cu}^{2+}(a q)+4 I(a q) \longrightarrow 2 \mathrm{CuI}(s)+I_{2}(a q) \quad \text { (1 point) }
$$

This is followed during titration by the reaction of iodine with the thiosulfate:

$$
\left.\begin{array}{ll}
2 \mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3}(\mathrm{aq})+I_{2}(\mathrm{aq}) \longrightarrow \mathrm{Na}_{2} \mathrm{~S}_{4} \mathrm{O}_{6}(\mathrm{aq})+2 \mathrm{NaI}(\mathrm{aq}) & \text { (1 point) } \\
\text { or } 2 \mathrm{Cu}^{2+}(\mathrm{aq})+4 I^{-}(\mathrm{aq}) & \longrightarrow 2 \mathrm{CuI}(\mathrm{~s})+I_{2}(\mathrm{aq}) \\
I_{2}(\mathrm{aq})+I^{-}(\mathrm{aq}) & \longrightarrow I_{3}(\mathrm{aq}) \\
I_{3}^{-}(\mathrm{aq})+2 \mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3}(\mathrm{aq}) & \longrightarrow \mathrm{Na}_{2} \mathrm{~S}_{4} \mathrm{O}_{6}(\mathrm{aq})+2 \mathrm{NaI}(\mathrm{aq})+I^{-}(\mathrm{aq})
\end{array} \text { (1 point) }\right)
$$

At equivalent point,

$$
\text { mol of } \mathrm{Cu}^{2+}=\text { mol of } \mathrm{S}_{2} \mathrm{O}_{3}{ }^{2-} \quad \text { (1 point) }
$$

$$
\left(C_{C u}{ }^{2+} \times V_{C u}{ }^{2+} / 1000\right)=\left(C_{S 2 O 3^{2-}} \times V_{S 2 O 3^{2-}} / 1000\right)
$$

$$
\mathrm{Cuu}^{2+}=\left(0.800 \mathrm{~mol} \mathrm{dm}{ }^{-3} \times 25.05 \mathrm{~cm}^{3}\right) / 25.00 \mathrm{~cm}^{3} \quad \text { (1 point) }
$$

$$
\begin{equation*}
\mathrm{C}_{\mathrm{Cu}^{2+}}=0.802 \mathrm{~mol} \mathrm{dm}{ }^{-3} \tag{0.5point}
\end{equation*}
$$

The concentration of $\mathbf{M}^{2+}(a q)$ solution is...... $0.802 \ldots \ldots . \mathrm{mol} \mathrm{dm}^{-3} \quad$ (0.5 point) (answer with 3 digits after decimal point)

If student cannot find the answer, the student can use $0.950 \mathrm{~mol} \mathrm{dm}^{-3}$ as the concentration of $\mathbf{M}^{2+}$ for further calculations.

4-A4) In Figure 1, if the hydrogen half-cell is under 0.360 bar hydrogen gas and the platinum electrode is immersed in a $500 \mathrm{~cm}^{3}$ buffer solution containing 0.050 mol lactic acid $\left(\mathrm{HC}_{3} \mathrm{H}_{5} \mathrm{O}_{3}\right)$ and 0.025 mol sodium lactate $\left(\mathrm{C}_{3} \mathrm{H}_{5} \mathrm{O}_{3} \mathrm{Na}\right)$, the electromotive force of the galvanic cell measured is +0.534 V . Calculate the pH of the buffer solution and the dissociation constant $\left(K_{\text {a }}\right)$ of lactic acid at $30.00^{\circ} \mathrm{C}$.

## Calculations of $\mathbf{p H}$ of the buffer solution

From the Nernst's equation:

$$
\begin{array}{rlrl}
E_{\text {cell }} & =E_{\text {cell }}^{\circ}-(\mathrm{RT} / \mathrm{nF}) \ln \left(\left[\mathrm{H}^{+}\right]^{2} / P_{H 2} \times\left[\mathrm{Cu}^{2+}\right]\right) \\
+0.534 V & =+0.340 \mathrm{~V}-\frac{\left(8.314 \mathrm{~J} \mathrm{~K}^{-1} \mathrm{~mol}^{-1}\right) \times(303.15 \mathrm{~K})}{2 \times 96485 \mathrm{Cmol}^{-1}} \ln \frac{\left[\mathrm{H}^{+}\right]^{2}(1 \text { point })}{(0.360 \text { bar }) \times\left(0.802 \mathrm{~mol} \mathrm{dm}^{-3}\right)} \\
-14.9 & =\ln \frac{\left[\mathrm{H}^{+}\right]^{2}}{(0.360 \mathrm{bar}) \times\left(0.802 \mathrm{~mol} \mathrm{dm}^{-3}\right)} & \\
3.52 \times 10^{-7} & =\frac{\left[\mathrm{H}^{+}\right]^{2}}{(0.360 \mathrm{bar}) \times\left(0.802 \mathrm{~mol} \mathrm{dm}^{-3}\right)} & \quad(1 \text { point }) \\
{\left[\mathrm{H}^{+}\right]} & =3.19 \times 10^{-4} \\
p H & =3.50 & & \\
\text { (0.5 point }) \\
\end{array}
$$

pH of the buffer solution is $\qquad$ .3.50. $\qquad$
(answer with 2 digits after decimal point)
or

$$
\begin{aligned}
& E_{\text {cel }}=E_{\text {cell }}-(2.303 \mathrm{RT} / n F) \log \left(\left[\mathrm{H}^{+}\right]^{2} / P_{H 2} \times\left[\mathrm{Cu}^{2+}\right]\right) \\
& +0.534 \mathrm{~V}=+0.340 \mathrm{~V}-\frac{2.303 \times\left(8.314 \mathrm{~J} \mathrm{~K}^{-1} \mathrm{~mol}^{-1}\right) \times(303.15 \mathrm{~K})}{2 \times 96485 \mathrm{Cmol}^{-1}} \log \frac{\left[\mathrm{H}^{+} \mathrm{T}^{2}\right.}{(0.360 \mathrm{bar}) \times\left(0.802 \mathrm{~mol} \mathrm{dm}^{-3}\right)} \\
& -6.45=\log \frac{\left[\mathrm{H}^{+}\right]^{2}}{(0.360 \mathrm{~atm}) \times\left(0.802 \mathrm{~mol} \mathrm{dm}^{-3}\right)} \\
& 3.53 \times 10^{-7}=\frac{\left[\mathrm{H}^{+}\right]^{2}}{(0.360 \mathrm{~atm}) \times\left(0.802 \mathrm{~mol} \mathrm{dm}^{-3}\right)} \\
& {\left[H^{+}\right]=3.19 \times 10^{4}} \\
& \mathrm{pH}=3.50(2 \text { digits }) \\
& \mathrm{pH} \text { of the buffer solution is } \\
& 3.50
\end{aligned}
$$

(Answer with 2 digits after decimal point)

If student cannot find the answer, the student can use 3.46 as the buffer pH for further calculations.

```
Calculations of the dissociation constant ( }\mp@subsup{K}{\textrm{a}}{}\mathrm{ ) of lactic acid
The buffer solution composes of HC, }\mp@subsup{\textrm{C}}{3}{}\mp@subsup{\textrm{H}}{5}{}\mp@subsup{O}{3}{}\mathrm{ and }\mp@subsup{\textrm{C}}{3}{}\mp@subsup{\textrm{H}}{5}{}\mp@subsup{O}{3}{}\textrm{Na}\mathrm{ ,
the pH of the solution can be calculated from the Henderson-Hasselbalch Equation.
[ C3H5OO3Na] = 0.050 mol \times1000 \mp@subsup{\textrm{cm}}{}{3}}=0.10 m00\mp@subsup{\textrm{cm}}{}{3
```

```
(0.5 point)
pH=pKa}+\operatorname{log}([\mp@subsup{\textrm{C}}{3}{}\mp@subsup{\textrm{H}}{5}{}\mp@subsup{O}{3}{}\textrm{Na}]/[\mp@subsup{\textrm{HC}}{3}{}\mp@subsup{\textrm{H}}{5}{}\mp@subsup{O}{3}{}]) (1 point
3.50=pKa}+\operatorname{log}(0.050/0.10
pKa}=3.80 (0.5 point
Ka}=1.58\times1\mp@subsup{0}{}{-4}\quad(0.5 point
The dissociation constant of lactic acid is
```

$\qquad$

``` \(1.58 \times 10^{-4}\) (0.5 point)
```

## Problem 5

$5 \%$ of the total

| Problem$5$ | A |  | B | C |  | D | Total |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | A1 | A2 |  | C1 | C2 |  |  |
| Total | 1 | 1 | 3 | 1 | 2 | 2 | 10 |
| Score |  |  |  |  |  |  |  |

## Problem 5: Phosphate and silicate in soil

Distribution and mobility of phosphorus in soil are usually studied by sequential extraction. Sequential extraction is performed by the use of acid or alkaline reagents to fractionate inorganic phosphorus in soil. Soil sample was extracted and analyzed as follows:

## Part A. Determination of total phosphate ( $\mathrm{PO}_{4}{ }^{3-}$ ) and silicate ( $\mathbf{S i O}_{4}{ }^{4-}$ )

A 5.00 gram of soil sample is digested to give a final volume of $50.0 \mathrm{~cm}^{3}$ digesting solution which dissolves total phosphorus and silicon. The extract is analyzed for the total concentrations of phosphorus and silicon. The concentrations of phosphorus and silicon are found to be $5.16 \mathrm{mg} \mathrm{dm}^{-3}$ and $5.35 \mathrm{mg} \mathrm{dm}^{-3}$, respectively.

5-A1) Determine the mass of $\mathrm{PO}_{4}{ }^{3-}$ in mg per 1.00 g of soil.

## Calculations

$\therefore 1 \mathrm{~g}$ of soil contains $\mathrm{PO}_{4}{ }^{3-}=$ $\qquad$ mg (answer with 3 digits after decimal point)

5-A2) Determine the mass of $\mathrm{SiO}_{4}{ }^{4-}$ in mg per 1.00 g of soil.

## Calculations

$\therefore 1 \mathrm{~g}$ of soil contains $\mathrm{SiO}_{4}{ }^{4-}=$ $\qquad$ mg (answer with 3 digits after decimal point)

## Part B. Determination of available $\mathrm{PO}_{4}{ }^{\mathbf{3 -}}$ in acid extract

Phosphate can be analyzed by using molybdenum blue method. One mole of phosphate is converted into one mole of molybdenum blue compound. This method is used for determination of phosphate in the acid extract. Absorbance (A) and transmittance (T) are recorded at 800 nm . The molar absorptivity of the molybdenum blue compound is $6720 \mathrm{dm}^{3}$ $\mathrm{mol}^{-1} \mathrm{~cm}^{-1}$ and all measurement is carried out in a $1.00-\mathrm{cm}$ cuvette.

Transmittance and absorbance are given by the following equations:

$$
\begin{aligned}
& \mathrm{T}=\mathrm{I} / \mathrm{I}_{\mathrm{o}} \\
& \mathrm{~A}=\log \left(\mathrm{I}_{\mathrm{o}} / \mathrm{I}\right)
\end{aligned}
$$

where $I$ is the intensity of the transmitted light and $I_{o}$ is the intensity of the incident light.

5-B1) When the sample containing high concentration of phosphate is analyzed, a reference solution of $7.5 \times 10^{-5} \mathrm{~mol} \mathrm{dm}^{-3}$ of molybdenum blue compound is used for adjusting zero absorbance. The transmittance of the sample solution is then measured to be 0.55 . Calculate the concentration of phosphate ( $\mathrm{mol} \mathrm{dm}^{-3}$ ) in the sample solution.

## Calculations

$\therefore$ concentration of phosphate in an unknown sample $=$ $\qquad$ mol dm ${ }^{-3}$

## Part C. Determination of $\mathrm{PO}_{4}{ }^{3-}$ and $\mathrm{SiO}_{4}{ }^{4-}$ in alkaline extract

Both phosphate and silicate ions can react with molybdate in alkaline solution, producing the yellow molybdophosphate and molybdatosilicate. Further reduction with ascorbic acid produces intense color molybdenum blue compounds. Both complexes exhibit maximum absorption at 800 nm . Addition of tartaric acid helps preventing interference from silicate in the determination of phosphate.

Two series of phosphate standard are treated with and without tartaric acid whereas a series of silicate standard is not treated with tartaric acid. Linear equations obtained from those calibration curves are as follows:

| Conditions | Linear equations |
| :--- | :--- |
| Phosphate with and without tartaric acid | $\mathrm{y}=6720 \mathrm{x}_{1}$ |
| Silicate without tartaric acid | $\mathrm{y}=868 \mathrm{x}_{2}$ |

y is absorbance at 800 nm ,
$\mathrm{x}_{1}$ is concentration of phosphate as $\mathrm{mol} \mathrm{dm}^{-3}$,
$\mathrm{x}_{2}$ is concentration of silicate as $\mathrm{mol} \mathrm{dm}^{-3}$
Absorbance at 800 nm of the alkaline fraction of the soil extract after treated with and without tartaric acid are 0.267 and 0.510 , respectively.

5-C1) Calculate the phosphate concentration in the alkaline soil extract in $\mathrm{mol}_{\mathrm{dm}^{-3}}$ and calculate the corresponding phosphorous in $\mathrm{mg} \mathrm{dm}^{-3}$.

## Calculations

$\therefore$ concentration of $\mathrm{PO}_{4}{ }^{3-}=$ $\qquad$ $\mathrm{mol} \mathrm{dm}^{-3}$
$\therefore$ concentration of $\mathrm{P}=$ $\qquad$ $\mathrm{mg} \mathrm{dm}^{-3}$
(answer with 2 digits after decimal point)

5-C2) Calculate the silicate concentration from the soil sample in $t$ the alkaline fraction in mol $\mathrm{dm}^{-3}$ and calculate the corresponding silicon in $\mathrm{mg} \mathrm{dm}^{-3}$.

## Calculations

$\therefore$ concentration of $\mathrm{SiO}_{4}{ }^{4-}=$ $\qquad$ mol dm ${ }^{-3}$
(answer with 2 digits after decimal point)
$\therefore$ concentration of $\mathrm{Si}=$ $\mathrm{mg} \mathrm{dm}^{-3}$
(answer with 2 digits after decimal point)

## Part D. Preconcentration of ammonium phosphomolybdate

A $100 \mathrm{~cm}^{3}$ of aqueous sample of ammonium phosphomolybdate $\left(\left(\mathrm{NH}_{4}\right)_{3} \mathrm{PMo}_{12} \mathrm{O}_{40}\right)$ compound is extracted with $5.0 \mathrm{~cm}^{3}$ of an organic solvent. The organic-water partition coefficient ( $\mathrm{K}_{\text {ow }}$ ) is defined as the ratio of the concentration of the compound in the organic phase ( $\mathrm{c}_{\mathrm{o}}$ ) to that in the water phase ( $\mathrm{c}_{\mathrm{w}}$ ). $\mathrm{K}_{\text {ow }}$ of the ammonium phosphomolybdate is 5.0. The molar absorptivity of ammonium phosphomolybdate in the organic phase is $5000 \mathrm{dm}^{3} \mathrm{~mol}^{-1} \mathrm{~cm}^{-1}$.

5-D) If the absorbance in the organic phase is 0.200 , calculate the total mass of phosphorus (in mg unit) in the original aqueous sample solution. The optical pathlength of the cuvette is 1.00 cm .

## Calculations

## Problem 5

$5 \%$ of the total

| Problem | A |  | B | C |  | D | Total |

## Problem 5: Phosphate and silicate in soil

Distribution and mobility of phosphorus in soil are usually studied by sequential extraction. Sequential extraction is performed by the use of acid or alkaline reagents to fractionate inorganic phosphorus in soil. Soil sample was extracted and analyzed as follows:

## Part A. Determination of total phosphate ( $\mathrm{PO}_{4}{ }^{3-}$ ) and silicate $\left(\mathrm{SiO}_{4}{ }^{4-}\right)$

A 5.00 gram of soil sample is digested to give a final volume of $50.0 \mathrm{~cm}^{3}$ digesting solution which dissolves total phosphorus and silicon. The extract is analyzed for the total concentrations of phosphorus and silicon. The concentrations of phosphorus and silicon are found to be $5.16 \mathrm{mg} \mathrm{dm}^{-3}$ and $5.35 \mathrm{mg} \mathrm{dm}^{-3}$, respectively.

5-A1) Determine the mass of $\mathrm{PO}_{4}{ }^{3-}$ in mg per 1.00 g of soil. (1 point)

## Calculations

P 30.97 g from $\mathrm{PO}_{4}{ }^{3-} 94.97 \mathrm{~g}$
P 5.16 mg from $\mathrm{PO}_{4}{ }^{3-}(94.97 / 30.97) \times 5.16=15.82 \mathrm{mg} \mathrm{dm}^{-3}$
In $50 \mathrm{~cm}^{3}$ solution, $\mathrm{PO}_{4}{ }^{3-}=(15.82 / 1000) \times 50=0.791 \mathrm{mg}$
5 g of soil contains $\mathrm{PO}_{4}{ }^{3-} 0.791 \mathrm{mg}$
$\therefore 1 \mathrm{~g}$ of soil contains $\mathrm{PO}_{4}{ }^{3-}=$ $\qquad$ 0.158 mg (answer in 3 digits after decimal point) (1 point)

5-A2) Determine the mass of $\mathrm{SiO}_{4}{ }^{4-}$ in mg per 1.00 g of soil. (1 point)

## Calculations

Si 28.09 g from $\mathrm{SiO}_{4}{ }^{4-} 92.09 \mathrm{~g}$
Si 5.35 mg from SiO ${ }_{4}{ }^{4-} \quad(92.09 / 28.09) \times 5.35=17.539 \mathrm{mg}$
In $50 \mathrm{~cm}^{3}$ solution, $\mathrm{SiO}_{4}{ }^{4-}=(17.539 / 1000) \times 50=0.877 \mathrm{mg}$
5 g of soil contains $\mathrm{SiO}_{4}{ }^{4-} 0.877 \mathrm{mg}$
$\therefore 1 \mathrm{~g}$ of soil contains $\mathrm{SiO}_{4}{ }^{4-}=$ $\qquad$ mg (answer in 3 digits after decimal point) (1 point)

## Part B. Determination of available $\mathrm{PO}_{4}{ }^{3-}$ in acid extract

Phosphate can be analyzed by using molybdenum blue method. One mole of phosphate is converted into one mole of molybdenum blue compound. This method is used for determination of phosphate in the acid extract. Absorbance (A) and transmittance (T) are recorded at 800 nm . The molar absorptivity of the molybdenum blue compound is $6720 \mathrm{dm}^{3}$ $\mathrm{mol}^{-1} \mathrm{~cm}^{-1}$ and all measurement is carried out in a $1.00-\mathrm{cm}$ cuvette.

Transmittance and absorbance are given by the following equations:

$$
\begin{aligned}
& \mathrm{T}=\mathrm{I} / \mathrm{I}_{\mathrm{o}} \\
& \mathrm{~A}=\log \left(\mathrm{I}_{\mathrm{o}} / \mathrm{I}\right)
\end{aligned}
$$

where $I$ is the intensity of the transmitted light and $I_{o}$ is the intensity of the incident light.

5-B1) When the sample containing high concentration of phosphate is analyzed, a reference solution of $7.5 \times 10^{-5} \mathrm{~mol} \mathrm{dm}^{-3}$ of molybdenum blue compound is used for adjusting zero absorbance. The transmittance of the sample solution is then measured to be 0.55 . Calculate the concentration of phosphate ( $\mathrm{mol} \mathrm{dm}{ }^{-3}$ ) in the sample solution. (3 points)

## Part C. Determination of $\mathrm{PO}_{4}{ }^{3-}$ and $\mathrm{SiO}_{4}{ }^{4-}$ in alkaline extract

Both phosphate and silicate ions can react with molybdate in alkaline solution, producing the yellow molybdophosphate and molybdatosilicate. Further reduction with ascorbic acid produces intense color molybdenum blue compounds. Both complexes exhibit maximum absorption at 800 nm . Addition of tartaric acid helps preventing interference from silicate in the determination of phosphate.

Two series of phosphate standard are treated with and without tartaric acid whereas a series of silicate standard is not treated with tartaric acid. Linear equations obtained from those calibration curves are as follows:

| Conditions | Linear equations |
| :--- | :--- |
| Phosphate with and without tartaric acid | $\mathrm{y}=6720 \mathrm{x}_{1}$ |
| Silicate without tartaric acid | $\mathrm{y}=868 \mathrm{x}_{2}$ |

y is absorbance at 800 nm ,
$\mathrm{x}_{1}$ is concentration of phosphate as $\mathrm{mol} \mathrm{dm}^{-3}$,
$\mathrm{x}_{2}$ is concentration of silicate as $\mathrm{mol} \mathrm{dm}^{-3}$

Absorbance at 800 nm of the alkaline fraction of the soil extract after treated with and without tartaric acid are 0.267 and 0.510 , respectively.

5-C1) Calculate the phosphate concentration in the alkaline soil extract in $\mathrm{mol}_{\mathrm{dm}^{-3}}$ and calculate the corresponding phosphorous in $\mathrm{mg} \mathrm{dm}^{-3}$. (1 point)

## Calculations

Conc. $\mathrm{PO}_{4}{ }^{3-}=(0.267 / 6720)=3.97 \times 10^{-5} \mathrm{~mol} \mathrm{dm}^{-3}$
$\therefore$ concentration of $\mathrm{PO}_{4}{ }^{3-}=3.97 \times 10^{-5} \mathrm{~mol} \mathrm{dm}^{-3} \quad$ ( 0.5 point $)$

Conc. $P=\left(3.97 \times 10^{-5} \mathrm{~mol} \mathrm{dm}^{-3}\right)\left(30.97 \mathrm{~g} \mathrm{~mol}^{-1}\right)\left(1000 \mathrm{mg} \mathrm{g}^{-1}\right)=1.23 \mathrm{mg} \mathrm{dm}^{-3}$
$\therefore$ concentration of $\mathrm{P}=1.23 \mathrm{mg} \mathrm{dm}^{-3} \quad 2$ digits after decimal point $\quad$ (0.5 point)

5-C2) Calculate the silicate concentration from the soil sample in $t$ the alkaline fraction in mol $\mathrm{dm}^{-3}$ and calculate the corresponding silicon in $\mathrm{mg} \mathrm{dm}^{-3}$. (2 points)

## Calculations

Abs of $\mathrm{PO}_{4}{ }^{3-}=\left(3.97 \times 10^{-5} \mathrm{~mol} \mathrm{dm}^{-3}\right)(6720)=0.267$
Abs of $\mathrm{SiO}_{4}{ }^{4-}$ in sample $=0.510-0.267=0.243$
Conc. $\mathrm{SiO}_{4}{ }^{4-}=(0.243 / 868)=2.80 \times 10^{-4} \mathrm{~mol} \mathrm{dm}^{-3}$
$\therefore$ concentration of $\mathrm{SiO}_{4}{ }^{4-}=\underline{2.80 \times 10^{-4}} \mathrm{~mol} \mathrm{dm}^{-3} \quad$ (1 point)
Conc. $\mathrm{Si}=\left(2.80 \times 10^{-4} \mathrm{~mol} \mathrm{dm} m^{-3}\right)\left(28.09 \mathrm{~g} \mathrm{~mol}^{-1}\right)\left(1000 \mathrm{mg} \mathrm{g}^{-1}\right)=7.87 \mathrm{mg} \mathrm{dm}^{-3}$
$\therefore$ concentration of $\mathrm{Si}=7.87 \mathrm{mg} \mathrm{dm}^{-3} \quad 2$ digits after decimal point (1 point)

## Part D. Preconcentration of ammonium phosphomolybdate

A $100 \mathrm{~cm}^{3}$ of aqueous sample of ammonium phosphomolybdate $\left(\left(\mathrm{NH}_{4}\right)_{3} \mathrm{PMol}_{2} \mathrm{O}_{40}\right)$ compound is extracted with $5.0 \mathrm{~cm}^{3}$ of an organic solvent. The organic-water partition coefficient ( $\mathrm{K}_{\mathrm{ow}}$ ) is defined as the ratio of the concentration of the compound in the organic phase ( $\mathrm{c}_{\mathrm{o}}$ ) to that in the water phase ( $\mathrm{c}_{\mathrm{w}}$ ). $\mathrm{K}_{\text {ow }}$ of the ammonium phosphomolybdate is 5.0. The molar absorptivity of ammonium phosphomolybdate in the organic phase is $5000 \mathrm{dm}^{3} \mathrm{~mol}^{-1} \mathrm{~cm}^{-1}$.

5-D) If the absorbance in the organic phase is 0.200 , calculate the total mass of phosphorus (in mg unit) in the original aqueous sample solution. The optical pathlength of the cuvette is 1.00 cm. (2 points)

## Calculations

$$
C_{o}=0.200 / 5000=4 \times 10^{-5} \mathrm{~mol} \mathrm{dm}
$$

The volume of the organic phase is $5.0 \mathrm{~cm}^{3}$, therefore ammonium phosphomolybdate in the organic phase

$$
=\left(4 \times 10^{-5} \mathrm{~mol} \mathrm{dm} m^{-3}\right)\left(5 \mathrm{~cm}^{3}\right) / 1000 \mathrm{~cm}^{3} \mathrm{dm}^{-3}=2 \times 10^{-7} \mathrm{~mol}
$$

From $K_{o w}=C_{o} / C_{w}=5.0$

$$
\begin{equation*}
C_{w}=\left(4 \times 10^{-5} \mathrm{~mol} \mathrm{dm}^{-3}\right) / 5=8 \times 10^{-6} \mathrm{~mol} \mathrm{dm}^{-3} \tag{0.5point}
\end{equation*}
$$

The volume of the aqueous solution is $100 \mathrm{~cm}^{3}$, therefore ammonium phosphomolybdate in the aqueous solution

$$
\left.\left.\begin{array}{l}
=\left(8 \times 10^{-6} \mathrm{~mol} \mathrm{dm}\right. \\
-3
\end{array}\right)\left(100 \mathrm{~cm}^{3}\right) / 1000 \mathrm{~cm}^{3} \mathrm{dm}^{-3}\right) \text { } 8 \times 10^{-7} \mathrm{~mol} ~ \$
$$

Therefore, the total mol of ammonium phosphomolybdate $=\left(2 \times 10^{-7}\right)+\left(8 \times 10^{-7}\right) \mathrm{mol}$

$$
=1 \times 10^{-6} \mathrm{~mol} \quad(0.5 \text { point })
$$

Total amount of $P=\left(1 \times 10^{-6} \mathrm{~mol}\right)\left(30.97 \mathrm{~g} \mathrm{~mol}^{-1}\right)\left(1000 \mathrm{mg} \mathrm{g}^{-1}\right)=0.031 \mathrm{mg} \quad(0.5$ point $)$
$\therefore$ total amount of P in the original aqueous solution $=$ $\qquad$ mg
